## **Tree Inventory and Tree Preservation Plan**

### **1. Introduction**

In 2015 North-South Environmental Inc. (NSE) was retained by Black, Shoemaker, Robinson Donaldson Limited (BSRD) to conduct an Environmental Impact Study (EIS) for a proposed development at the Ainley Farm property, legally described as Lots 17 and 18, Concession 12, Township of Centre Wellington, County of Wellington (herein referred to as the "Subject Property"). The property includes approximately 19 hectares (ha) of land, with frontage on Gerrie Road to the east and access to the future extension of Walser Drive to the west. The Subject Property is illustrated in **Figure 1**. In winter 2021, BSRD requested NSE complete a Tree Inventory and Preservation Plan, as well as an assessment of potential bat habitat in conjunction with the Environmental Impact Study (EIS) Addendum. This report should be read in conjunction with the EIS (2017), EIS Addendums (2020; 2022), and all other design plans for the project.

The need for a tree inventory and preservation plan is necessitated by the proposed development area of the site. Surveyed trees include those with potential to be impacted by the proposed development area (i.e., removal, potentially injured). This includes areas of the woodland edge, consisting of cultural woodland and thicket along the northwest and northeast side of the wooded area, and the area along the proposed sanitation line (running through the southern portion of Subject Property from the agricultural land, through the southeastern woodland edge, and extending southeast through municipal land) (see **Figure 1**). Trees surveyed fall under a combination of the County of Wellington Conservation and Sustainable Use of Woodlands Tree By-law (5115-09) and the Public Forest Policy (Centre Wellington 2018).

The development area has been designed to avoid wetlands and mature natural vegetation as much as possible. The development will mainly occupy areas that were previously used as agricultural land. The total woodland area found on the Subject Property is 7.986 ha, the total area planned for removal is 0.763 ha, with a total of 7.223 ha of woodland area being preserved on the Subject Property. The number of trees within the preserved woodland area is estimated to be 3100 trees  $\geq$  10 DBH<sup>1</sup>. This estimate is likely conservative.

This arborist report provides a policy assessment, tree inventory results, and a proposed tree protection and removal plan.

<sup>&</sup>lt;sup>1</sup>Number of trees estimated to be preserved within the woodland area has been calculated by using the tree inventory completed by NSE within the southeast and northeast woodland areas planned for removal, to estimate the density of trees  $\geq$ 10 diameter at breast height (DBH). The average of the tree densities from the two areas was used as a proxy for the overall woodland density. The estimated density is 430.6 trees / ha. The calculation for total estimated trees preserved involves taking the average density of trees / ha and multiplying by the woodland area preserved (i.e., 430.6 trees / ha x 7.223 ha). This calculation results in an estimated tree preservation of 3100 trees  $\geq$ 10 DBH within the woodland area being preserved.

## north-south

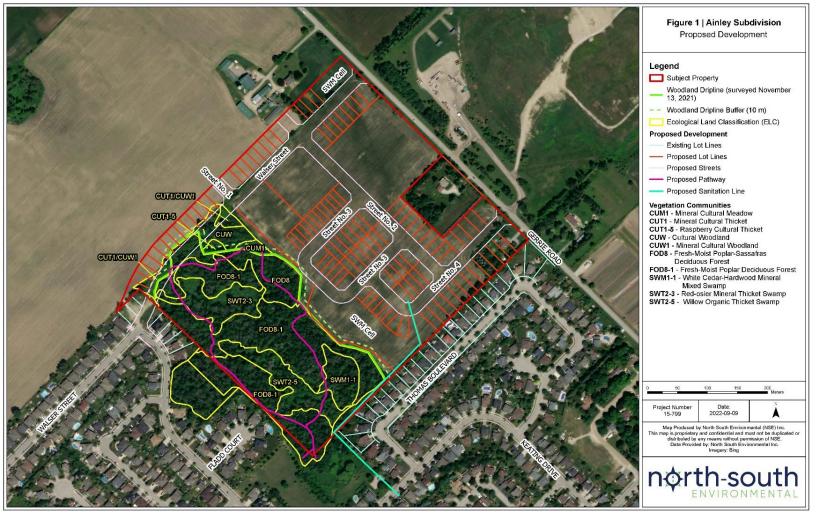

Figure 1. The Subject Property and ELC at Lots 17 and 18, Concession 12, Township of Centre Wellington (Geographic Township of Nichol), County of Wellington

#### **1.1.** Policy Context

#### 1.1.1. County of Wellington Official Plan

#### 1.1.1.1. Policy Overview

A full summary of Natural Heritage Features identified on the Subject Property and potential impacts to features and ecological functions has been provided in the EIS (2017), EIS Addendum (2020), and EIS Addendum (2022). In addition, the EIS and addenda has also provided a full policy review of the County of Wellington Official Plan 2013 to ensure the proposed develop conforms with relevant natural heritage policies.

Schedule 1A of the County of Wellington Official Plan (2013) includes all provincially and locally significant wetlands as part of the Core Greenlands designation. All other wetlands not identified as part of the Core Greenlands will be protected and development that would negatively impact their ecological functions shall be avoided.

#### 1.1.1.1. Subject Property Assessment

The woodland (which contains wetland) on the Subject Property has been mapped as Core Greenland in the County of Wellington Official Plan Schedule 1A (County of Wellington Official Plan 2013).

## 1.1.2. Grand River Conservation Authority Regulations (under Ontario Regulation 150/06)

#### 1.1.2.1. Policy Overview

Ontario Regulation (O.Reg.) 150/06 under the Conservation Authorities Act gives Grand River Conservation Authority (GRCA) the authority to regulate development, interference with wetlands and alterations to shorelines and watercourses. Generally, GRCA regulates floodplains, hazard lands, and wetlands.

#### 1.1.2.2. Subject Property Assessment

GRCA (2018) Regulation Mapping (**Figure 2**) illustrates a non-provincially significant wetland within the wooded area on the western portion of the Subject Property. The extent of the "Regulated Area" on the Subject Property is mapped as 120 m from the boundary of the wetland mapped by GRCA.

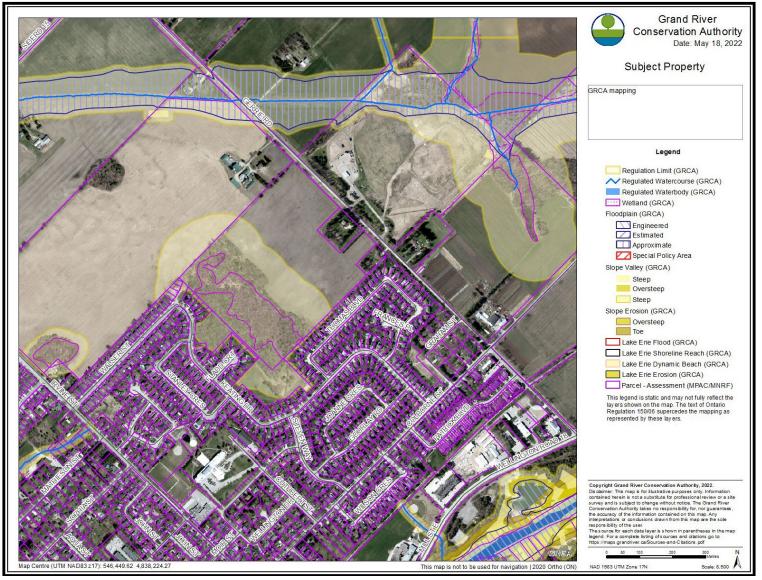

Figure 2. GRCA (2022) mapping illustrating aerial mapping of wetland (purple) and regulated area (yellow)

#### **1.1.3. Township of Centre Wellington**

The Township of Centre Wellington has a by-law that regulates trees within woodlands of at least 1 hectare in size. With respect to development proposals, tree removals can be addressed under the by-law (i.e., for removals that will occur before draft plan approval), or through the site plan approval process. Further, the Township has a policy document that provides guidance on how the Township intends to manage municipally owned trees. The Township does not have a private tree by-law that regulates individual trees on private property, or woodlands less than one hectare in size.

## 1.1.3.1. Conservation and Sustainable Use of Woodlands By-law (5115-09) (2009)

#### Policy Overview

The Conservation and Sustainable Use of Woodlands By-law (5115-09) (2009) regulates the destruction or injury of trees in woodlands. In the by-law "woodlands" is defined as "land, one hectare (2.47 acres) or more in area measured to the drip line, and includes any unforested corridors within the area that are equal to or less than 30 m (98.4 feet) in width, with at least:

- 1,000 trees, of any size, per hectare (405 trees, of any size, per acre);
- 750 trees, measuring over 5 cm in DBH, per hectare (304 trees, measuring over 2 inches in DBH, per acre);
- 500 trees, measuring over 12 cm in DBH, per hectare (202 trees, measuring over 4.7 inches in DBH, per acre); or
- 250 trees, measuring over 20 cm in DBH, per hectare (101 trees, measuring over 7.9 inches in DBH, per acre)."

The by-law excludes cultivated fruit orchards, nut orchards or plantations established for the purpose of producing Christmas trees.

#### Subject Property Assessment

The treed area, shown on **Figure 1** within the woodland dripline limit, meets size criteria to be considered a woodland. Further, while tree density surveys were not completed, the treed area is also believed to meet density requirements to be considered a woodland.

#### 1.1.3.2. Public Forest Policy (2018)

#### Policy Overview

The Public Forest Policy (Centre Wellington 2018) applies to municipally owned trees.

The Public Forest Policy includes details on approved tree species (Appendix 1), tree planting details (Appendix 2), tree preservation details (Appendix 3), minimum caliper size of planted trees (Appendix 4), and tree planting setbacks (Appendix 5).

Per Section C.2.2, trees shall be replaced at a ratio of 2:1. Per Section C.4., no more than 10 percent of any one species of tree shall be planted at any planting site, no more than 6 trees of any one species shall be planted in a row on either side of the street (refer to section C.4).

#### Subject Property Assessment

Municipal street trees were surveyed as part of this arborist report. Further, as per direction from the Town and its peer reviewer, Natural Resource Solutions Inc. (NRSI), we have applied the Public Forest Policy compensation ratio for individual tree removals and tree removals within hedgerows (please see Agency Correspondence in **Appendix 5**).

#### 1.1.4. Canadian Food Inspection Agency Directive: D-03-08 (2021)

#### 1.1.4.1. Policy Overview

The Canadian Food Inspection Agency (CFIA) regulates the movement of all Ash (*Fraxinus spp.*) material, including logs, bark, branches, fresh leaves, woodchips, and nursery stock to control the spread of a non-native beetle, the Emerald Ash Borer, whose larvae burrow into Ash. To slow the spread of Emerald Ash Borer to new areas, Ash material may not be transported outside of a regulated area into a non-regulated area. People who move regulated materials from regulated areas within the permission of the CFIA could face fines and/or prosecution. A map of the Emerald Ash Borer - Canadian Food Inspection Agency (canada.ca)

#### 1.1.5. Subject Property Assessment

Ash trees are present on the Subject Property. Ash material may not be transported outside of a regulated area into a non-regulated area.

#### 1.1.6. Migratory Birds Convention Act (1994)

#### 1.1.6.1. Policy Overview

The *Migratory Birds Convention Act* (MBCA) and its *Regulations* protect listed migratory birds in Canada through the conservation of populations, individuals, and their nests. Article I of the MBCA identifies migratory species that are protected under this act. It is a contravention of this act to harass, harm, or kill protected migratory birds, remove, or disrupt their nests, and/or eggs.

#### 1.1.6.2. Subject Property Assessment

The Subject Property contains habitat for migratory birds. Migratory birds could be impacted during works (tree / shrub removals). In addition to destruction of habitat, noise, vibrations and light from construction activities could disturb birds outside of the development footprint and deter them from their nests.

north-south

Any tree and vegetation removals should be conducted outside of the active bird nesting season (generally outside of April 1 - August 31). Where this is not possible, a qualified avian biologist should search the area within 48 hours of these activities as a due diligence measure to demonstrate compliance with the MBCA. Despite nest searches being conducted, some nests may go undetected. Therefore, if migratory birds, their nests or eggs are encountered during tree/vegetation removal activities, the works shall cease, and the consulting ecologist or Environment Canada be contacted for advice. A protective buffer will be placed around the nest and works will be prohibited within the buffer until the young have fledged.

#### 1.1.7. Endangered Species Act (2007)

#### 1.1.7.1. Policy Overview

The *Endangered Species Act* (ESA) provides regulatory protection for Species at Risk and their habitat in Ontario. Species listed as Endangered and Threatened, and habitat for those species, is protected from development under the ESA. Habitat for Special Concern species is not protected under the ESA but is considered Significant Wildlife Habitat (SWH) and is protected under Section 2.1 of the 2020 *Provincial Policy Statement* (PPS).

#### 1.1.7.2. Subject Property Assessment

None of the trees species inventoried are considered Species at Risk.

#### 1.1.8. Ontario Forestry Act (1990)

#### 1.1.8.1. Policy Overview

The *Forestry Act* provides criteria for identifying treed areas that qualify as woodlands based on an assessment of tree diameter and density. It also provides a directive on boundary tree identification and regulates the injury or destruction of boundary trees. A boundary tree is defined in Section 10 (2) as a "tree whose trunk is growing on the boundary between adjoining lands" and "is the common property of the owners of the adjoining lands". Section 10 (3) states that "every person who injures or destroys a tree growing on the boundary between adjoining lands without the consent of the landowners is guilty of an offence under this Act." The *Forestry Act* does not provide a definition of 'tree trunk' which has since been addressed via case law (Hartley v Cunningham et al, 2013 ONSC 2929). Per case law, a tree trunk is defined as the "entire trunk from its point of growth away from its roots up to its top where it branches out to limbs and foliage" (ibid). Therefore, boundary trees are trees where any part of the trunk (i.e., not restricted to the base of the trunk) straddles a property line.

#### 1.1.8.2. Subject Property Assessment

Presumed boundary trees are present on the Subject Property and have been noted in the Tree Inventory Table (**Appendix 2**). Verification of tree ownership and consent to injure or remove boundary trees is the responsibility of the proponent.

### **1.2.** Proposed Development

The proposed development on the Subject Property is illustrated in **Figure 1**.

The proposed residential development includes 113 single detached lots, 4 future single detached lots, a townhouse block, an apartment block, 2 stormwater management facilities, a park, and a large open space block. The development area has been designed to avoid wetlands and mature natural vegetation as much as possible. The development will mainly occupy areas that were previously used as agricultural land. Areas of woodland edge, consisting of cultural woodland and thicket along the northwest and northeast side of the wooded area, will be removed for the Walser Street extension and stormwater treatment (**Figure 1**). There will be some removal of vegetation, including trees, for placement of a sanitary sewer line along the southeast edge of the woodland. See the EIS Addendum (2022) for the grading plan.

In order to connect the Ainley Farm property to the existing subdivision to the southwest, the access road to the site will encroach into successional areas along the northwest side of the natural vegetation block as well as a small area of wetland. Development of storm water facilities along the northeast side of the natural vegetation block will also require removal of a portion of the successional vegetation along the northeastern boundary.

Where a buffer has been identified between the woodland and the proposed development, it ranges from 0 m (adjacent to the storm water management block) to 10 m. Since the wetland is contained within the woodland, the distance between the wetland the proposed development ranges from 10 m at two points where the wetland extends eastward, to approximately 80 m. As noted in the previous paragraph, on the northwest side of the development, it will not be possible to maintain a buffer due to the development of the Walser St. Extension.

Sanitary sewer service will be provided to the site via the installation of a new 200 mm diameter sanitary sewer on a 6 m wide easement from Keating Drive, running along the south boundary of the vegetation block. This area was previously occupied by a municipal drain, which was modified at the time of the development to the south. Water service for the site will be provided by the installation of a new 200 mm diameter watermain on Walser Street, connecting to the existing watermain on Walser Street. The implementation of services will require removal of very few trees.

### 2. Methods

The tree inventory was completed on November 30<sup>th</sup> 2021, May 6<sup>th</sup> 2022, and May 13<sup>th</sup> 2022 by Pauline Catling, Senior Ecologist; ISA Certified Arborist (ON-2721A) and Devin Bettencourt, Junior Ecologist; ISA Certified Arborist (ON-2831A). Tree diameter (DBH) was measured at approximately 1.4 m above grade. DBH for split stemmed trees was calculated by adding the DBH of each stem. All standing trees

equal to or greater than 10 cm diameter at breast height (DBH) that could be impacted by the proposed development were inventoried. GPS location was recorded using a handheld GPS unit.

Trunk integrity, crown structure, and crown vigour were evaluated, and the canopy height and width were estimated. Trees were tagged with aluminum tree tags for easy recognition. Trees on adjacent property or Township property were not tagged, and DBH was estimated. Trees bordering between the Subject Property and adjacent properties were also not tagged without adjacent landowner permission and DBH was estimated. Following the examination of these parameters, the tree vigour class was determined to categorize the condition of the tree. These classes range from excellent (1) to dead (6). These criteria are provided in **Appendix 1**.

#### 3. Results and Discussion

A total of 343 trees were inventoried, of which 278 occurred on the Subject Property, 6 occurred along the border between adjacent properties and the Subject Property (i.e., 'boundary trees'), 40 occurred on Township property, and 19 occurred on adjacent properties (see the Tree Inventory table provided in **Appendix 2**). Tree locations and tag numbers are marked on the Tree Preservation Plan (**Appendix 3**). Adjacent landowners and the Township must be consulted and provide permission before injury/removal of off-site or boundary trees. Township of Centre Wellington will need to be consulted and provide permission to determine the process for requesting removal / injury of Township owned trees as part of the site plan application.

A total of 282 trees were native (83%), most common of which was Trembling Aspen (*Populus tremuloides*). 58 trees were non-native including: Domestic Apple (*Malus pumila*), Manitoba Maple (*Acer negundo*), Horse Chestnut (*Aesculus hippocastanum*), Amur Maple (*Acer ginnala*), Columnar English Oak (*Quercus robur 'Fastigiata'*), Norway Maple (*Acer platanoides*), and Sweet Cherry (*Prunus avium*). Manitoba Maple (*Acer negundo*), while native to Ontario is generally not considered indigenous to the Wellington area. The highly invasive European Buckthorn (*Rhamnus cathartica*), a shrub, was not included in the inventory but is present in high numbers within the area.

Trees ranged from excellent to dead in condition. The majority of trees surveyed were in excellent condition (**Table 1**). A total of 122 trees were in excellent condition, of which 111 were native species. 100 trees were in good condition, of which 70 were native species. All other trees ranged from fair to dead in condition. Tree size ranged from 10 to 160 cm (**Table 2**), the largest being a split stemmed Manitoba Maple (*Acer negundo*). No Heritage Trees or Species at Risk were present within the survey area.

#### Table 1. Summary of Tree Vigor Class for Trees Surveyed

		Condition*								
Common Name	Latin Name	1	2	3	4	5	6	Total

#### 3.1. Trees to be Removed/ Injured/ Retained

With the proposed plan, 320 trees will be removed and 21 have the potential to be injured (**Table 5**). Trees to be removed for the proposed development are trees that fall directly in the development footprint or trees that will be severely impacted by grading, excavation and/or construction activities. Of the 320 trees to be removed, 278 are located within the Subject Property, 6 trees along the boundary of the Subject Property and adjacent properties, and 36 trees within Township property that will require permission for removal. Guidelines for removal are as follows:

- Trees approved for removal must be clearly marked on-site, preferably with orange or yellow spray paint at breast height (1.4 m) and at the base of the stem (stump height) as per the Ontario Tree Marking Guide;
- Tree removal cannot proceed until written approval of the TIPP has been granted by The Township;
- Approved tree removals shall be carried out prior to site works and in such a manner as to minimize site disturbance and damage to trees to be retained;
- Approved tree protection fencing must be installed and inspected prior to tree removals unless otherwise approved by the Township;
- The Canadian Food Inspection Agency (CFIA) restricts the movement of any part of trees infested with or host to a regulated pest or disease. For more information about transporting regulated material, contact your local CFIA office;
- Timing of removals should avoid the migratory bird window of April 1<sup>st</sup> to August 30<sup>th</sup>

Trees identified as retained but that may be injured as a result of construction activity may have impacts to the root system, however tree stability and health should not be compromised with appropriate mitigation (e.g., root pruning, mulching of exposed roots, watering and fertilizing if more extensive root damage occurs). The potential to impact retained trees was determined by the amount and type of work to be completed within the Minimum Tree Protection Zone (MTPZ) in combination with factors related to age, species, and an assessment of the current health. It was determined that based on the proposed plan, 21 trees (17 trees on adjacent properties and 4 on Township property) will be injured. Trees identified as "retained" include trees either far enough away from proposed work so that they should not experience any injury or trees that are already dead. These trees would have no work proposed within their MTPZ.

No trees are recommended for relocation. It was determined that trees surveyed on site were not suitable for relocation because of their non-native status or large size. Larger trees are harder to relocate, and older trees are less likely to survive relocation or damage.

#### **3.2.** Potential Impacts to Remaining Trees

The majority of the surveyed trees are to be removed. The removal of trees and construction activities has the potential to impact adjacent retained trees via soil compaction, excavation, or increasing erosion potential in the surrounding area. Potential impacts to these trees are expected to be minor and are not expected to cause fatal injury. Impacts to injured trees may be direct or indirect and may include:

- Injury to roots or reduction in available water due to soil compaction within the root zone
- Acute or chronic effects of pollutants such as fuels, oils, salts, etc.
- · Reduction or increase in soil moisture water due to alteration of the adjacent lands

#### 3.3. Arborist Recommendations

- 1. Compensation planting for trees to be removed as outlined in **Section 4**.
- 2. Tree protection measures for retained trees as outlined in **Section 5**.
- 3. Mitigation measures for trees to be injured as outlined in **Section 5**.
- 4. Adjacent property owners sharing boundary trees proposed for removal or trees to be injured will need to provide authorization made aware of the proposed development and potential effects on their trees.

#### 4. Tree Compensation

The County of Wellington Conservation and Sustainable Use of Woodlands Tree By-law (5115-09) does not state specific details on tree compensation. Recommendations for tree compensation has been determined by Madison Postma, Registered Professional Forester from Natural Resource Solutions Inc. (NRSI) and approved by Mariana Iglesias, Senior Planner and Mat Alain, Urban Forestry Project Manager from the Township of Wellington (**Appendix 5**). A map illustrating the breakdown of tree compensation ratios by area is provided in **Appendix 4**.

Tree compensation for the removal of 35 municipally owned trees located in the southern portion of the study area (park north of Keating Dr.) and hedgerow / individual trees within the Subject Property will be compensated according to the standards listed within the Public Forest Policy (Centre Wellington 2018) (2:1 ratio, meaning 2 trees for every tree removed equal to or larger than 10 cm DBH). Therefore, 70 trees will need to be planted as compensation, with a caliper size of 50 mm to 70 mm.

Tree compensation for the removal of 38 hedgerow/individual trees located within the Subject Property will be compensated according to the standards listed within the Public Forest Policy (Centre Wellington 2018) (2:1 ratio, meaning 2 trees for every tree removed equal to or larger than 10 cm DBH). Therefore, 76 trees will need to be planted as compensation, with a caliper size of 50 mm to 70 mm.

The area of woodland proposed for removal will be compensated at a 1:1 ratio in order to maintain tree canopy cover. NRSI requested that tree planting occur at density of 1200 trees per hectare of any size. If tree planting of larger caliper species is proposed within the development envelope, the density/numbers of trees per hectare will be adjusted consistent with the Forestry Act (e.g., 750 over 5 cm diameter per hectare). The proposed development plan will result in the removal of 0.763 ha woodland trees. Based on the area proposed for removal, 916 trees of any size (e.g., whips, 50-100 cm height) will be planted for compensation. This is based on the calculation of (0.763)(1200) = 916 trees. Planted trees shall come with a 2-year warranty period and monitoring be conducted during this period to determine numbers of replacement trees.

To summarize, a total of 916 replacement trees of any size will be required for removal within the woodland, a total of 76 trees of caliper size 50 mm to 70 mm will be required for removal within the hedgerows / individual trees, and a total 70 trees of caliper size 50 mm to 70 mm will be required for removal of municipality owned trees. **Table 3** below provides a summary of compensation requirements for trees proposed for removal for each area.

Tree Removal Location	Compensation Requirement	Live Tree Removals <sup>3</sup>	Total area planned for removal <sup>3</sup>	Required Replacement Trees		
Woodland Trees	1200 trees/ha removed	200	0.763 ha	<b>916</b> (any size) <sup>1</sup>		
Hedgerows/Individual Trees	2 trees for every 1 trees removed with a DBH ≥ 10)	38	N/A	<b>76</b> (caliper size of 50mm to 70mm) <sup>2</sup>		
Municipality Owned Trees	2 trees for every 1 trees removed with a DBH ≥ 10)	35	N/A	<b>70</b> (caliper size of 50mm to 70mm) <sup>2</sup>		

Table 3. Summary of Compensation Requirements for Trees Proposed for Removal

<sup>1</sup>As per the recommendations of NRSI and the Township of Wellington (1200 trees/ha)

<sup>2</sup>Based on compensation requirements provided in the Public Forest Policy (Centre Wellington 2018)

<sup>3</sup>Dead trees are not included, as they do not require compensation

For trees removed within the Subject Property, it is believed the Subject Property is large enough in size to accommodate the replacement of trees directly on site. A map illustrating the available restoration area, equal to 1.055 ha, is provided within **Appendix 4**. Therefore, financial compensation is not considered a necessary means of fulfilling the required compensation recommendations. Compensation should be confirmed with the Township of Wellington. For trees removed outside of the Subject Property and owned by the municipality, discussion with the Township of Wellington is required to confirm the location of replacement trees.

Compensation plantings should be assessed for quality by a Certified Arborist prior to planting as well as after planting to assess ongoing health. Compensation plantings should be cared for with appropriate pruning, watering, and mulching. All pruning must be conducted by or supervised by an Arborist.

Trees planted for compensation within the Subject Property shall include species indigenous to south central Ontario area and suited to the local hydrological and soil conditions. **Table 4** provides a summary of trees species proposed as replacement trees within the Subject Property. Other native tree species may also be considered as approved by a consulting ecologist.

Scientific Name	Common Name
Acer saccharum	Sugar Maple
Betula papyrifera	Paper Birch
Juglans nigra	Black Walnut
Ostrya virginiana	Eastern Hop-hornbeam
Picea glauca	White Spruce
Pinus strobus	Eastern White Pine
Populus balsamifera	Balsam Poplar
Populus tremuloides	Trembling Aspen
Prunus serotina	Black Cherry
Quercus rubra	Red Oak
Thuja occidentalis	Eastern White Cedar
Tilia americana	American Basswood

#### Table 4: Summary of Tree Species Proposed to be Planted within the Subject Property

\*Other native tree species may also be considered

For municipally owned trees, conditions within the Public Forest Policy apply. For a list of suitable tree species for Centre Wellington refer to Appendix 1, for tree planting details refer to Appendix 2, and for tree planting specifications refer to Appendix 4 within the Public Forest Policy (Centre Wellington 2018).

#### 5. Tree Preservation

#### 5.1. Recommended Tree Protection and Mitigation Measures

According to the proposed plan, no trees within the development footprint on the Subject Property will be retained. 21 trees on Township and adjacent lands will be retained but may be injured by the proposed works.

In order to prevent fatal injury to the trees recommended for protection, Minimum Tree Protection Zone (MTPZ) shall be established according to the requirements in Appendix 3 of the Public Forest Policy (Centre Wellington 2018), which defines minimum MTPZ distance based on tree DBH. MTPZ

has been listed in **Table 5** (see also **Appendix 2**). MTPZ shall be established and delineated with protection fencing to prevent entry by the contractors during construction. The MTPZ detailed below should be measured from the tree trunk.

Table 5. Trees potentia					Loca		
Species	DBH (cm)	Height (m)	Canopy Radius (m)	Condition <sup>1</sup>	X Coord	Y Coord	MTPZ (m)

American Elm <i>Ulmus americana</i>	18	14	3.5	1	-80.423818	43.693882	1.8

 $^{1}1 =$  excellent condition, 2 = good condition, 3 = fair condition, 4 = poor condition, 5 = very poor condition, 6 = dead.

Tree protection fencing shall be installed to the specifications detailed in Appendix 3 of the Public Forest Policy (Centre Wellington 2018). Entry into tree protection zones by the contractor shall be prohibited. If entry into tree protection zones is required to accommodate construction, a Certified Arborist shall be consulted to ensure construction activities do not cause injury to the trees. Tree protection fencing shall be installed prior to commencing construction and maintained throughout the duration of the proposed works.

#### 5.1.1. Root Pruning in Excavation Area to be Supervised by Qualified Arborist

If excavation within the root zones of trees to be protected is required, root pruning shall be undertaken or supervised by a qualified arborist and follow the guidelines in Appendix 3 of the Public Forest Policy (Centre Wellington 2018).

#### 5.1.2. Equipment Refueling to be Conducted away from Natural Vegetation

During construction, refueling of equipment shall be conducted a minimum of 30 m away from the Core Area.

#### 5.1.3. Recommendation to Minimize Use of Deicing Salts during Site Occupation

It is recommended that long-term occupants of the Subject Property minimize salt application on the driveways and paths in order to prevent potential chronic effects of salts on trees and other vegetation.

#### 5.2. Monitoring Requirements

It is recommended that a Certified Arborist be on site to supervise critical stages, including:

- Tree marking and removal;
- · Installation of tree protection hoarding and other tree protection measures;
- Excavation or grading within the MTPZ, and root pruning, if required;
- Occurrences of physical tree injury;
- Site preparation for planting; and
- Tree planting and maintenance.

Reporting requirements may be required by the Township of Wellington at any critical stage of development. Tree protection fencing should be inspected bi-monthly or on a timeline agreed upon with the Township of Centre Wellington. Erosion and sediment control inspections should ensure that no work occurs outside of the designated work area in order to ensure no harm comes to additional trees outside of the Subject Property and proposed sanitation line area. Post-construction monitoring should be completed by an Arborist to assess health of compensation plantings and nearby trees.

#### 5.3. Additional Mitigation Measures

- Vegetation removal should occur outside of the breeding bird season for Nesting Zone C2 (April 1- August 31) (Government of Canada 2017).
- Erosion and sediment control measures as outlined in the EIS (2017) should be followed.
- Clearing equipment and vehicles should be cleaned to prevent the introduction of non-native species (Clean Equipment Protocol for Industry, 2013).
- Ash species removed should be mulched and disposed of on-site.
- Monitoring pre, during, and post-construction should be completed to provide adaptive management recommendations.
  - A 2-year monitoring program is required by the Township to ensure the woodland habitat has been adequately restored and compensated for.
- It is recommended that long-term occupants of the Subject Property minimize salt application on the driveways and paths in order to prevent potential chronic effects of salts on trees and other vegetation that may be planted in compensation.

### 6. Conclusion/ Summary

A total of 343 trees above 10 cm DBH were inventoried, of which 278 occurred on the Subject Property, 6 occurred along the border between adjacent properties and the Subject Property, 40 occurred on Township property, and 19 occurred on adjacent properties. The proposed works will require the removal of the majority of surveyed trees (320 total). Permission will be required for removal or injury of trees on adjacent properties and Township property including removal of 36 trees and injury of 21 trees. Additionally, there are 6 trees planned for removal which occur along the border between adjacent properties and the Subject Property where the ownership was unclear, these tree species will also require permission.

Tree compensation requires a total of 916 replacement trees of any size for removal within the woodland, a total of 76 trees of caliper size 50 mm to 70 mm for removal within the hedgerows / individual trees, and a total 70 trees of caliper size 50 mm to 70 mm for removal of municipality owned trees.

For trees removed within the Subject Property (i.e., woodland, hedgerow/individual trees), replacement trees can be planted within the restoration area illustrated in **Appendix 4**. For trees removed outside of the Subject Property, owned by the municipality, discussion with the Township of Wellington is required to confirm the location of replacement trees.

A site visit by a Certified Arborist should occur post-construction to ensure trees to be protected did not experience fatal injury and appropriate compensation plantings have occurred.

## **APPENDIX 1 | Tree Vigor Criterion**

#### **Trunk Integrity:**

- r root damage or decay
- st split stem/weak crotch
- br butt rot
- l excessive lean (e.g. 30° to 45°)
- h upper stem holes/decay
- w wound (bark damage, large pruning cuts)
- f fungus (conks)
- ib insect borers
- b burl
- wh woodpecker holes
- s seam or cracks
- c cankers
- ba bark loss

#### **Crown Structure:**

- bt broken top
- bl broken or severed primary limbs
- p pollarded (severe and improper pruning)
- ab adventitious branching (clusters of new shoots on main trunk)

#### **Crown Vigour:**

- db dead branch (less than 11% dead wood)
- dl moderate dead wood (e.g. 11 to 35% secondary branches mostly)
- d significant crown dieback (e.g. >35% dead wood in primary limbs)
- u undersized leaves
- fc foliar chlorosis/yellowing
- fn foliar necrosis/browning
- id insect defoliators (species if known)
- di disease (species if known)

#### **Tree Vigour Classes:**

#### Class 1 Excellent Condition, No Risk Trees

Sound, thrifty, full crowned trees of natural shape with no dead limbs in the top of the crown and no significant evidence of decline.

#### Class 2 Good Condition, Low Risk Trees

Full to medium crowned trees of natural shape with a live crown ratio ≥40% that exhibit no more than minor dead wood (e.g. up to 10% secondary branches only and mainly in the lower crown) and no more than one moderate trunk defect or indicator of decline.

#### Class 3 Fair Condition, Medium Risk Trees

Full to small crowned trees with a live crown ratio ≥25% that exhibit no more than moderate dead wood (e.g. 11 to 35% secondary branches mostly) and no more than two moderate trunk defects or indicators of decline.

#### Class 4 Poor Condition, High Risk Trees

Medium to very small crowned trees (e.g. live crown ratio < 25%) that exhibit one or more of the following conditions.

a) Trees with significant foliage of poor colour and less than normal size.

b) Trees with significant crown dieback (e.g. > 35% dead wood in primary limbs).

c) Trees with major trunk defects or decay (e.g. one extensive problem, or 3 or more distinct but moderate decline indicators).

#### Class 5 Very Poor Condition, Very High Risk Trees

Dying trees with very little live crown.

#### Class 6 Dead, Very High Risk Trees

Dead trees with no live crown.

Hi Devin,

I apologies for the delay in response, we appreciate your patience.

I have discussed with my fellow colleagues at NRSI the appropriate compensation ratios for the removal of the woodland edge on the Ainley Farm property. You had previously mentioned the Centre of Wellington Public Forest Policy specifies a 2:1 compensation ratio for the removal of municipally owned trees. It is of our opinion that a 2:1 ratio is suitable for individual and hedgerow trees, but is not suitable compensation for woodlands.

We recommend that woodland removals should be compensated for based on area (1:1) and that compensation should achieve the minimum tree density to be considered a woodland, which is "1,000 trees, of any size, per hectare", as defined in the County of Wellington Forest Conservation Bylaw (5115-09). This being said we also recommend increasing this ratio to 1,200 per ha and guaranteeing a 2-year monitoring program to ensure that woodland habitat has been adequately restored and compensated for.

Mariana Iglesias and Mat Alain, the Urban Forestry Project Manager for the Township, were also consulted and agree with our recommendation. They also believe that space is available on the property for compensation at a ratio of 1,200 per ha removed.

As for scope of work, in a previous email you had mentioned that your tree inventory will include the collection of all trees within the proposed Walser Street Extension limit of development along the north edge and sanitary alignment of the development along the south edge. We believe this is appropriate for the site. As for data collection please be sure to collect the follow data for each surveyed tree:

- 1. Tree species
- 2. Diameter at breast height (DBH)
- 3. Approximate height
- 4. Canopy width
- 5. General health (excellent, good, fair, poor, very poor, dead)
- 6. Potential for structural failure (improbable, possible, probable, imminent)
- 7. General comments

If a full bat habitat assessment has not already been completed, please ensure that any potential bat habitat is also noted and addressed for the impacted trees.

Please let me know if you have any further questions.

Thank you, Madison
