1. Introduction

GEI Consultants Canada Ltd. have prepared this Functional Servicing Report to address the site servicing and stormwater management requirements for the proposed development in support of the Draft Plan approval. The Draft Plan of Subdivision has been prepared by Polocorp Inc. (dated December 10, 2024).

The proposed 19.39 ha development (site) is located north of St. David Street N (Highway No. 6), east of existing commercial development, and south of existing agricultural lands in Fergus. There are external lands west of the proposed development that are also owned by the applicant and are currently used for agriculture. The adjacent additional lands owned by the applicant will be part of a separate application for development. Figure 1 shows the location of the proposed development and the surrounding area. The wetland area in the northeast limits of the site is regulated by the Grand River Conservation Authority (GRCA).

FERGUS SUBDIVISION - SOUTH LANDS
TOWNSHIP OF CENTRE WELLINGTON (FERGUS)

LOCATION PLAN

POLOCORP

Project 2401807

FEBRUARY 2025

Figure No. 1

2. Existing Conditions

2.1. Land Use

The site is currently a vacant agricultural field. One (1) existing dwelling is located along the southwest limits of the site. This dwelling is to remain under post-development conditions.

2.2. Topography

The majority of the site drains by sheetflow in an easterly direction towards the wetland along the northeast limits of the site. A portion of the site along the south limits sheetflows south to the roadside ditch along the Highway 6 right-of-way. The roadside ditch along Highway 6 ultimately discharges to a regulated watercourse downstream of the northeast wetland.

2.3. Soils

A Geotechnical Investigation has been completed by Chung & Vander Doelen Engineering Ltd. in 2025. The geotechnical investigation consisted of five (5) boreholes across the site to depths ranging from 5.2 m to 8.25 m below the ground surface (bgs) and three (3) additional boreholes on the adjacent property owned by the applicant. Based on the geotechnical investigation, the site soils generally consist of approximately 180 mm to 300 mm thick topsoil followed by clayey sand silt and sandy silt.

A copy of the Geotechnical Investigation is included in Appendix A.

2.4. Groundwater

A Preliminary Hydrogeological Investigation has been completed by Chung & Vander Doelen Engineering Ltd. in 2025. As part of the hydrogeological study, five (5) monitoring wells and four (4) shallow piezometers were installed between December 2023 and March 2024, as well as three (3) additional monitoring wells on the adjacent property owned by the applicant.

Groundwater monitoring results indicate that the seasonal high groundwater levels on site vary from 0.25 m below ground surface at the northeast limits of the site (BH/MW 8) to approximately 3.61 m below ground surface towards the southwest limits of the site (BH / MW 4). A copy of the Preliminary Hydrogeological Investigation is included in Appendix A.

3. Proposed Development

The proposed 19.39 ha residential development generally consists of 62-88 single-detached lots, 80–118 on-street townhouse units, 71-102 medium density residential units, 8-14 mixed use residential units, an open space block, internal roadways, and a stormwater management block. Figure 2 illustrates the proposed Draft Plan of Subdivision prepared by Polocorp Inc.. Connection to the site will be via the Street B connection to St. David Street N (Highway No. 6) and Streets A, D, E, and F to the adjacent property owned by the same applicant.

3.1. Site Grading

The site grading for the proposed residential lots, internal roads and stormwater management facility is shown on the Grading Plans. The site has been graded to match the Street B entrance elevations at Highway 6, and the property boundaries along the north, south, east and west portions of the site.

Internal roadways are graded with slopes ranging from 0.6% to 1.5%, while lots are generally graded with slopes ranging from 2% to 4%. The proposed lot grading patterns generally consists of split-drainage lots and back to front draining lots. 3:1 transition slopes are proposed in rear yard areas of select lots to accommodate the grade relief across the site.

3.2. Streets

The internal local roadways will be constructed as 20-23 m wide urban cross sections complete with concrete curb and gutter per Township of Centre Wellington Standards. The Street B right-of-way connection at St. David Street N (Highway No. 6) will be 26 m in width.

3.3. Water Supply

The proposed development will be serviced by extending a watermain along St. David Street N (Highway No. 7) in the westerly direction to the site entrance followed by which a local watermain will be extended throughout the site via the internal road network. The proposed watermain sizing will be completed as part of the detail design of the site once Draft Plan approval has been received.

Domestic water demands for the proposed development are calculated in Table 1 below.

Table No. 1: Domestic Water Demand Requirements

Unit Type	Population	Average Day (350 L/p/d)	Min Hour (Factor = 0.40)	Max Day (Factor = 2.75)	Max Hour (Factor = 4.13)
88 Single Family Lots (at 2.8 persons/lot)	246	1.00 L/s	0.40 L/s	2.75 L/s	4.13 L/s
118 On-Street Townhome Units (at 2.5 persons per lot)	295	1.20 L/s	0.48 L/s	3.30 L/s	4.96 L/s
102 Mixed Use / Medium Density Units – (at 2.5 persons per unit)	255	1.03 L/s	0.41 L/s	2.83 L/s	4.25 L/s
1 Existing Single Family Lot (at 2.8 persons/lot)	3	0.01 L/s	0.004 L/s	0.03 L/s	0.04 L/s
Total On-site Domestic Demands	799	3.24 L/s	1.29 L/s	8.91 L/s	13.38 L/s

Note: Population has been rounded to the nearest whole number.

A 25mm diameter water service lateral will be provided for each dwelling. Fire hydrants will be installed at a minimum radius of 150m in accordance with Township of Centre Wellington Development Manual.

The proposed watermain network layout is shown on the Servicing Plans.

There is an existing 300mm diameter watermain located on the east side of St. David Street North / Highway No. 6, which extends across a portion of the frontage of the subject lands, before terminating on the south side of Sideroad 18. The extension of a watermain from the existing 300mm watermain would provide adequate domestic and fire flow protection to the +/- 19.39-hectare development lands. Through discussions with the Township of Centre Wellington and Triton Engineering Services Limited, the existing 300mm diameter watermain has sufficient capacity to service these lands. The Township of Centre Wellington also confirmed that they are currently undertaking a Municipal Class Environmental Assessment (EA) to identify potential supply well location(s), to ensure that sufficient water supply is available to accommodate the additional demand resulting from the lands to be included within the Township's municipal boundary as part of the MCR (Municipal Comprehensive Review) process. Therefore, from a water supply and watermain servicing perspective, there are minimal works required to support the development of this property lands.

3.4. Sanitary Sewer

Each dwelling will be serviced via a proposed 100 mm diameter sanitary service lateral per Township of Centre Wellington Development Manual. Sanitary sewer design calculations have been attached as Appendix B. The sanitary sewer layout is shown on the Servicing Plans.

There is a recently constructed 300mm diameter sanitary sewer on the east side of St. David Street North / Highway No. 6, which has been terminated just south of Sideroad 18. Since this existing 300mm diameter sanitary sewer extends across a portion of the frontage of the subject lands, the extension of a

sanitary sewer from the existing 300mm diameter sanitary would provide a gravity sanitary sewer outlet for the +/- 19.39-hectare development. Per our correspondence with the Township of Centre Wellington and Triton Engineering Services Limited, there is sufficient capacity in the existing downstream sanitary sewer system and the downstream wastewater treatment plan (WWTP) to service these lands. This is based on our understanding that the planned upgrades to the WWTP, which are scheduled to occur in 2029, will ensure that sufficient treatment capacity exists for the lands to be included within the Township's municipal boundary as part of the MCR (Municipal Comprehensive Review) process. Therefore, from a sanitary sewer servicing perspective, there are minimal works required to support the development of this property lands and the lands can be efficiently and cost effectively serviced via a gravity connection to an existing sanitary sewer.

3.5. Storm Sewer

The storm sewer system on the internal roads will be sized to convey the 5-year design storm to the stormwater management facility per the Township of Centre Wellington Development Manual. Major storm events will be conveyed overland through the municipal rights-of-way to the stormwater management facility. Storm sewer design calculations have been attached as Appendix B. The stormwater management facility will outlet to the wetland along the northeast limits of the site to maintain existing drainage patterns.

Each lot will have a proposed 100 mm diameter storm service lateral connected to the proposed storm sewer system in the municipal right-of-way. Foundation drainage will be provided via sump pump discharge to the storm service lateral.

4. Stormwater Management Criteria

The studies, policies and guidelines used to develop the stormwater management plan are as follows:

- 1) The Stormwater Management Practices Planning and Design Manual, 1994
- 2) Stormwater Management Planning and Design Manual, 2003
- 3) The Interim Stormwater Quality Control Guidelines, 1991
- 4) The Stormwater Quality Best Management Practices Manual, 1991
- 5) The MTO Drainage Management Technical Guidelines, 1989
- 6) The Ontario Urban Drainage Design Guidelines, 1987
- 7) Low Impact Development Stormwater Management Planning and Design Guide, 2010

The stormwater management criteria are as follows:

- 1) Post-development flow rates for the site must be controlled to existing conditions rates for the 2 to 100 year design storm events.
- 2) Provide Enhanced level of quality control (80% Total Suspended Solids (TSS) removal) from all runoff discharging from the site.
- 3) Volume control performance should be evaluated for the 25mm storm event or through continuous modelling.
- 4) All efforts should be made to maximize infiltration wherever soil conditions allow.
- 5) Provide extended detention storage for the 25mm storm event.

The method used to evaluate and design the stormwater management plan is as follows:

The Fergus Shand Dam rainfall parameters presented in the Stormwater Management Master Plan for Centre Wellington (Elora, Salem and Fergus) (wsp Group, dated April 9, 2024) were used to generate the mass rainfall data for a 4-hour duration rainfall event for the full range of design storms (2 to 100-year). The 25mm storm for a 2-hour duration is also included within the table below. The Chicago storm parameters and the total depth of rainfall for each storm are as follows:

Table No. 2: Fergus Shand Dam - Chicago Storm Parameters

Parameter	25mm	2 Year	5 Year	10 Year	25 Year	50 Year	100 Year
a =	367.000	414.876	544.711	627.308	746.059	820.361	901.088
b =	5.000	0.0268	0.0206	0.0136	0.0851	0.0100	0.0426
c =	0.700	0.682	0.686	0.687	0.692	0.691	0.692
r =	0.394	0.375	0.375	0.375	0.375	0.375	0.375
td =	120.00	240.00	240.00	240.00	240.00	240.00	240.00
Rainfall depth (mm)	24.995	39.504	50.743	58.119	67.239	74.358	81.221

The Regional Storm (Hurricane Hazel) was also modelled.

The Horton infiltration method was used in the runoff calculations.

Table No. 3: MIDUSS – Horton Infiltration Parameters

Parameter	Impervious Areas	Pervious Areas
Maximum Infiltration (mm/hr)	0.0	30.0
Minimum Infiltration (mm/hr)	0.0	5.0
Lag Constant (hr)	0.0	0.25
Depression Storage (mm)	1.5	5.0

The hydrologic model MIDUSS was used to create the runoff hydrographs and to route the flows through the storage structures.

5. Stormwater Management Plan

The stormwater management design for the development accounts for the proposed development as well as for the future development of the adjacent lands also owned by the applicant in order to size the stormwater management facility for the future ultimate buildout of the second property. Interim Post-Development Conditions refers to the current proposed development and Ultimate Post-Development Conditions will refer to the future buildout of the adjacent property and how it will contribute to the proposed development.

5.1. Existing Conditions

For existing conditions analysis purposes, the site was modelled as four (4) drainage catchments. The existing conditions drainage catchments are shown on Figure 3 and described below. The existing conditions MIDUSS computer modelling is attached in Appendix C.

Catchment 10 (31.11 hectares, 2% impervious) represents the majority of the site. Runoff generated from Catchment 10 sheetflows east to the wetland along the northeast limits of the site.

Catchment 20 (2.98 hectares, 0% impervious) represents the westerly portion of the site. Runoff generated from Catchment 20 sheetflows overland in the westerly direction to the adjacent farm field and an offsite wetland.

Catchment 30 (2.00 hectares, 5% impervious) represents the southwesterly portion of the site. Runoff generated from Catchment 30 sheetflows overland to the roadside ditch in the Highway 6 right-of-way which then continues to sheetflow to an offsite regulated watercourse.

Catchment 40 (3.33 hectares, 0% impervious) represents the northeast portion of the site consisting of an existing wetland. Runoff generated from Catchment 40 contributes to the wetland extending north and east past the limits of the site.

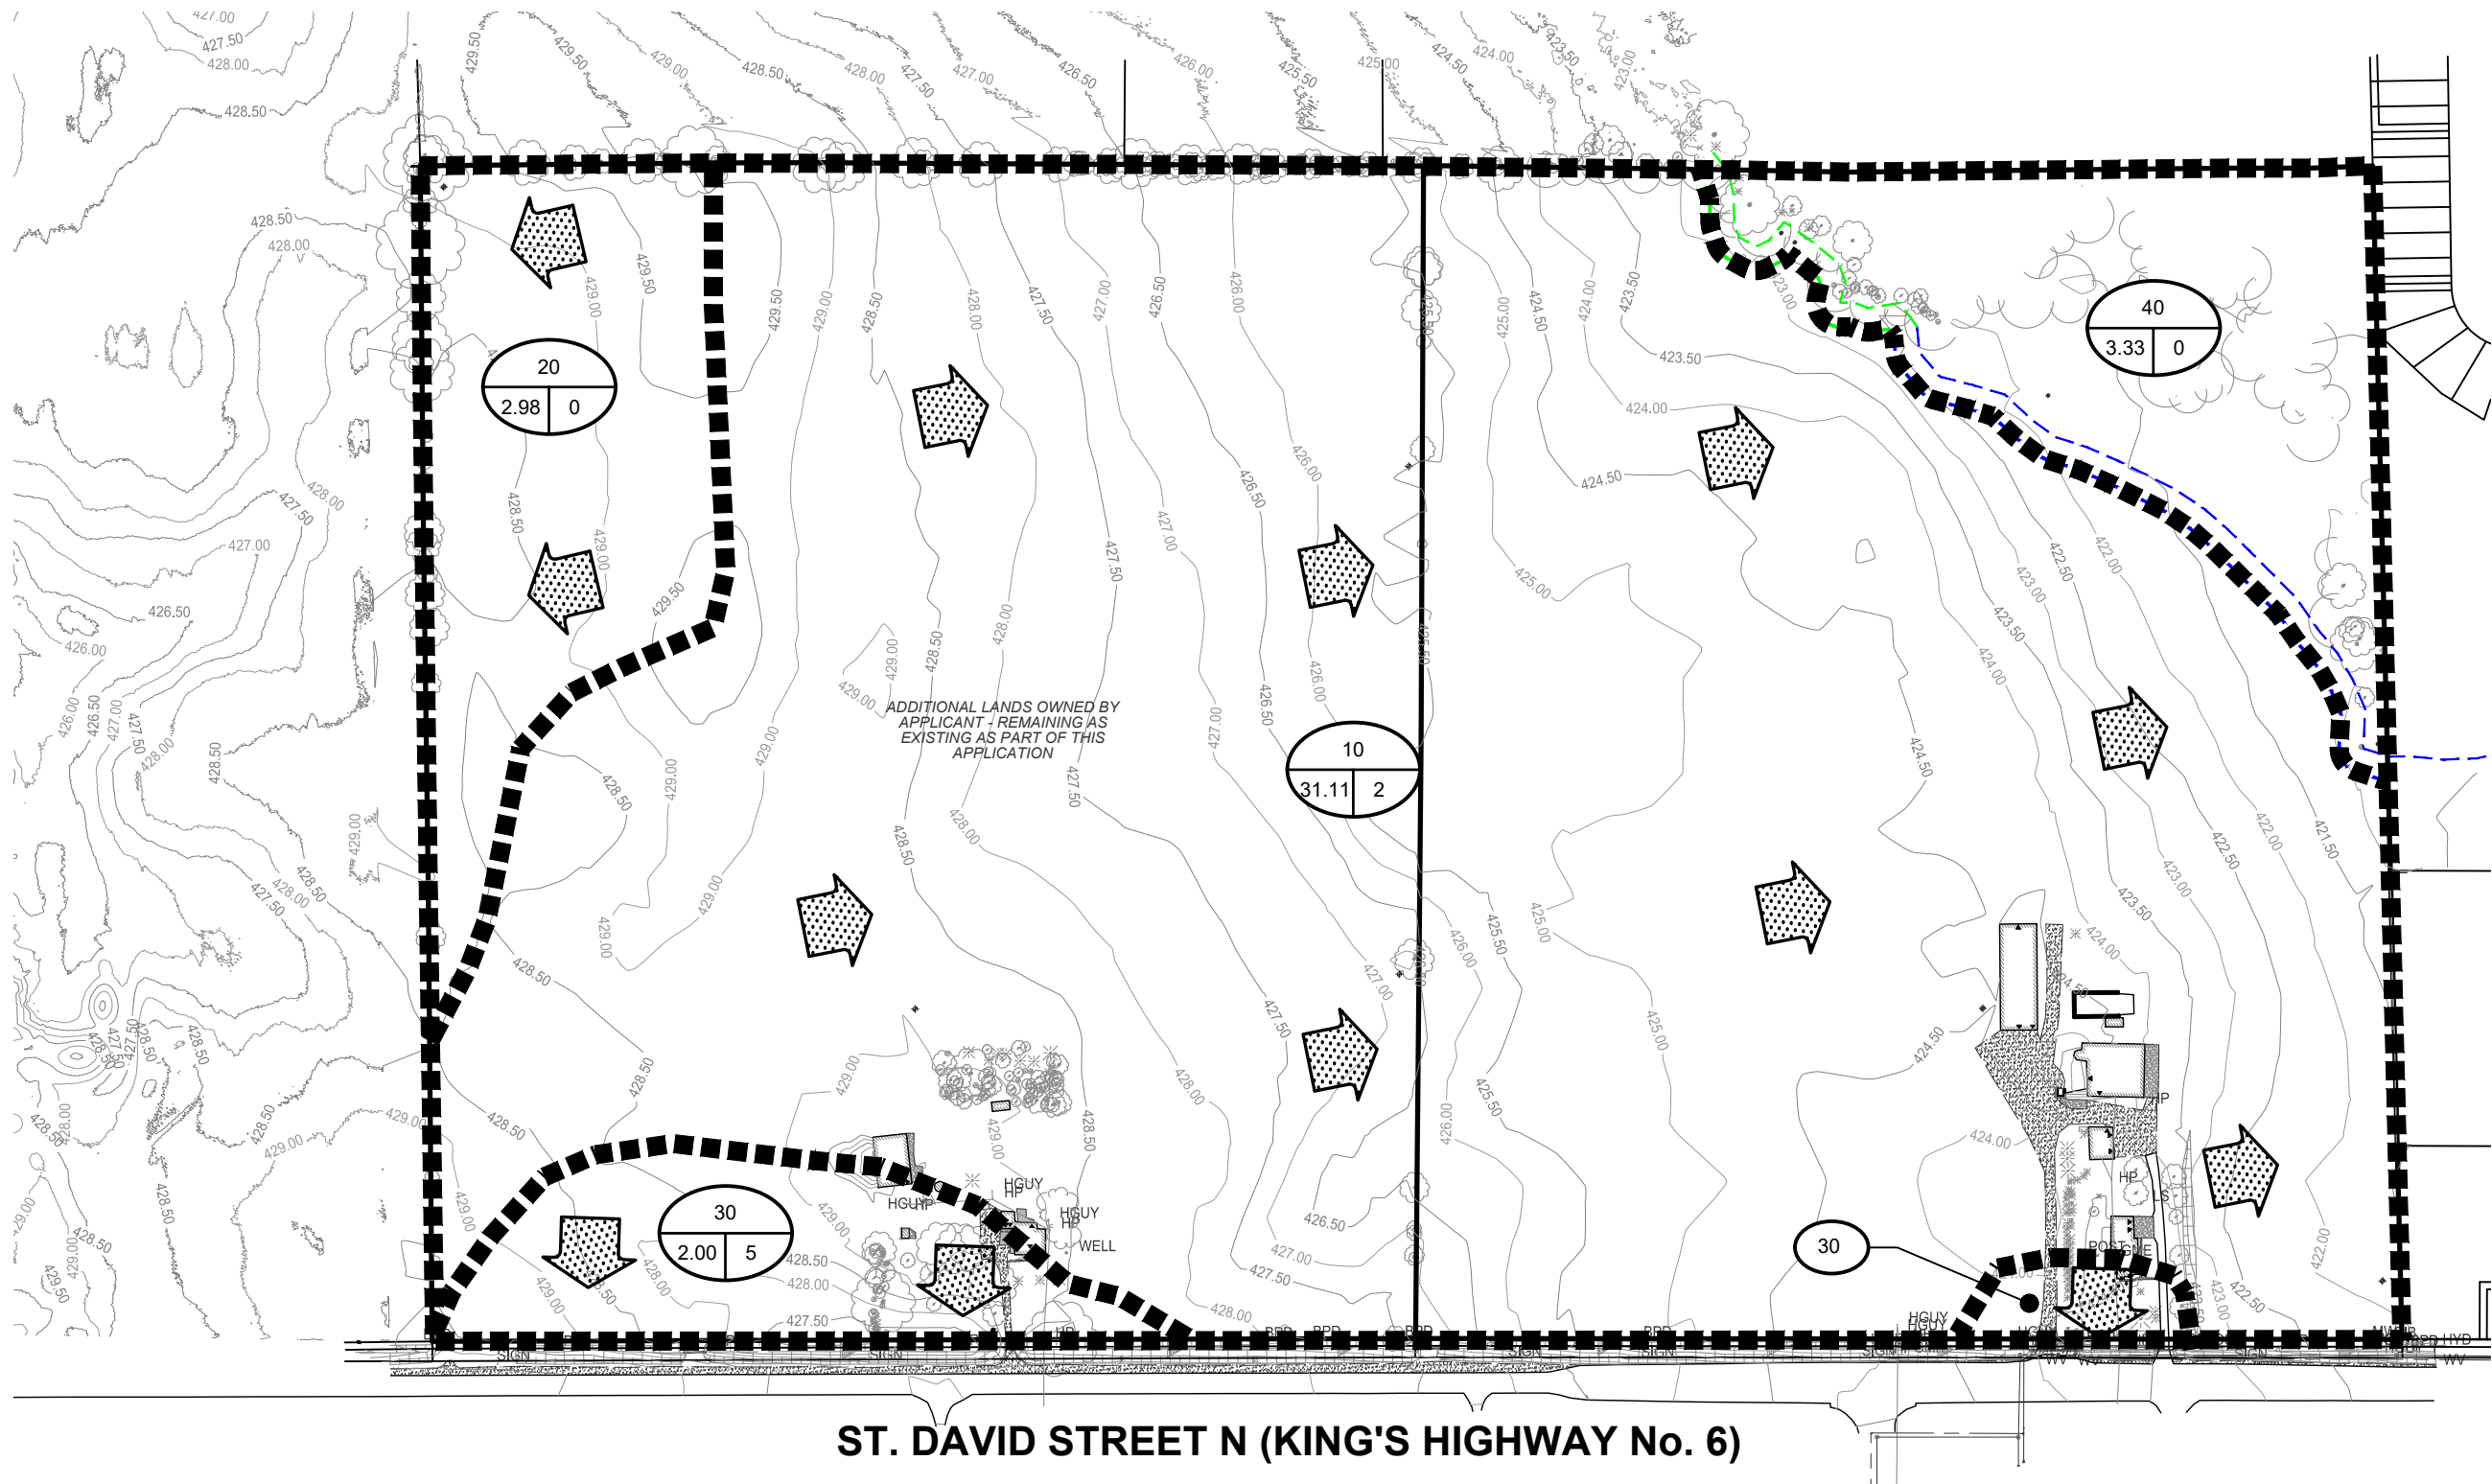

Table No. 4 lists the flow rates discharging from each catchment under existing conditions.

Table No. 4: Existing Conditions Flow Rates

	25 mm (m³/s)	2-Year (m³/s)	5-Year (m³/s)	10-Year (m³/s)	25-Year (m³/s)	50-Year (m³/s)	100-Year (m³/s)	Regional Storm (m³/s)
Catchment 10 – to Northeast Wetland	0.436	1.519	2.658	3.519	4.835	5.783	6.563	3.396
Catchment 20 – to Farm Field West of Site	0.049	0.169	0.317	0.405	0.532	0.633	0.734	0.327
Catchment 30 – to Highway 6	0.058	0.188	0.332	0.437	0.574	0.670	0.768	0.211
Catchment 40 – Northeast Wetland	0.056	0.193	0.356	0.455	0.607	0.720	0.835	0.366
Total Flow Rate	0.561	1.947	3.346	4.608	6.178	7.296	8.263	4.283

5.2. Stormwater Management Overview

In line with current practices and guidelines, the stormwater management approach for the North Lands Subdivision is designed as a “treatment train” to remove sediments and any absorbed contaminants prior to the discharge of runoff from the development to the receiving outlets. The “treatment train” approach will include a combination of lot level, conveyance and end-of-pipe best management practices and is proposed to filter and remove sediments from stormwater runoff prior to discharging off-site.

Lot Level Controls

Stormwater management practices recommended for providing lot level controls on this site are as follows:

a) Rooftop Infiltration

Each lot will have a rear yard infiltration gallery designed to infiltrate the 25 mm storm runoff from the proposed rooftop. The gallery connection to the roof downspout will include a splash pad and overflow for storm events greater than the 25 mm storm to discharge to ground surface followed by which the roof runoff will be directed to the grassed areas of the lot. The runoff for any event large enough to generate flow to the sewer system will be adequately filtered by the grass.

Design considerations that will be implemented in the infiltration galleries’ designs include:

- Located beneath frost penetration depth and minimum of 4 metres away from building foundations
- A 100-150mm diameter perforated vertical standpipe for inspection and flushing
- Leaf screens on downspouts
- 50mm clear stone with 30 to 40% void space

- Geotextile installed around the reservoir which considers their percent open area, load bearing ratio, and the texture and permeability of native soils

b) Rear Yard Swales

The grading of the lots will be to current Township of Centre Wellington Design Standards. Where practical, the length of the rear lot swales between catchbasins will be increased to extend the contact time with the grassed surfaces.

To promote more infiltration on the lots and in the swales, it is recommended that the average depth of graded topsoil be 300 mm.

c) Foundation Drainage

Foundation drainage will be provided for each lot via sump pumps discharging to storm service laterals.

Conveyance Controls

Conveyance controls will be achieved through municipal maintenance of the storm sewer system. The regular cleanout of the manholes and catchbasin sumps will remove the heavier sediments deposited from the runoff during storm events.

End of Pipe Facilities

The end-of-pipe component for Catchments 1000 and 2000 consists of the proposed stormwater management facility located near the south-easterly edge of the property, adjacent to the existing wetland and Highway 6 (St. David Street N). The stormwater management facility will have two (2) outlet structures. Outlet Structure No. 1 consists of a 1200mm diameter double ditch inlet catchbasin with a 200mm diameter minor flow orifice and a 600mm pipe outlet, which will discharge to the wetland along the northeast limits of the site. Outlet Structure No. 2 consists of a 1200mm diameter double ditch inlet catchbasin with a 525mm pipe outlet, which will discharge to the wetland along the northeast limits of the site.

The proposed stormwater management facility has been designed as wetland type facility complete with a forebay and a 0.3 m deep permanent pool to provide the required water quality controls. The proposed outlet structure is designed to provide a 48-hour extended detention of the 4-hour 25 mm design storm event as per the Township of Centre Wellington requirements.

Water Quality

The proposed stormwater management facility has been designed to function as a wetland. From Table 3.2, Stormwater Management Planning and Design Manual, 2003, in order to provide Enhanced water quality treatment, a wetland facility requires 128 m³/ha of storage volume for a contributing drainage area that is 76% impervious. 40 m³/ha of the required storage volume is extended detention volume, while the remaining 88 m³/ha is permanent pool.

Based on a contributing site area of 33.57 hectares (Catchments 1000 and 2000 in ultimate post-development conditions) and a requirement for 88 m³/ha of permanent pool storage volume to achieve Enhanced treatment, the required permanent pool storage is 2,954 m³.

The proposed stormwater management facility has been designed with a 0.3-metre-deep permanent pool, which provides 3,003 m³ of permanent pool volume. An additional permanent pool volume of 875 m³ will be provided in the sediment forebay.

Extended Detention

Extended detention volume is calculated based on the runoff volume generated by the 4-hour 25 mm design storm event. The outlet structure has been designed to provide a 51-hour detention of the required extended detention volume, which corresponds to a release rate of 0.043 m³/s.

Drawdown calculations for the 4-hour 25 mm storm event are included in **Appendix C**.

5.3. Interim Post-Development Conditions

For analysis of interim post-development conditions, the site was modelled as eight (8) drainage catchments. The interim condition drainage catchments are shown on Figure 4 and described below. The post-development MIDUSS computer modelling is attached in Appendix C.

Catchment 100 (13.09 hectares, 80% impervious) represents the majority of the currently proposed development. Runoff generated from Catchment 100 will be captured and conveyed to the proposed stormwater management facility via on-site storm sewers.

Catchment 200 (2.02 hectares, 15% impervious) represents the proposed stormwater management facility. The proposed stormwater management facility is designed to provide the required Enhanced level of protection prior to discharging to the wetland along the northeast limits of the site.

Catchment 300 (1.35 hectares, 50% impervious) represents a portion of the proposed development adjacent to the northeast wetland. Runoff generated from Catchment 300 will sheetflow overland, uncontrolled, to the northeast wetland.

Catchment 400 (3.33 hectares, 0% impervious) represents the northeast portion of the site consisting of an existing wetland. Runoff generated from Catchment 400 contributes to the wetland extending north and east past the limits of the site.

Catchment 500 (14.80, 1% impervious) represents the majority of the future development which will be constructed under ultimate post-development conditions. Runoff generated from Catchment 500 will sheetflow overland east, ultimately discharging to the proposed stormwater management facility.

Catchment 600 (0.12 hectares, 5% impervious) represents a portion of the proposed development which will be constructed under interim conditions, adjacent to the Highway 6 right-of-way. Runoff generated from Catchment 600 will sheetflow overland to the roadside ditch on Highway 6 right-of-way, ultimately discharging to a regulated watercourse.

ST. DAVID STREET N (KING'S HIGHWAY No. 6)

NOTE:

				POLOCORP		Project 2401807

Catchment 700 (2.98, 0% impervious) represents a westerly portion of the future development area and reflects pre-development conditions. Runoff generated from Catchment 700 sheetflows overland in the westerly direction to the adjacent farm field and an offsite wetland.

Catchment 800 (1.73, 5% impervious) represents a southwesterly portion of the site which will be developed under ultimate post-development conditions. Runoff generated from Catchment 800 sheetflows overland to the roadside ditch in the Highway 6 right-of-way which then continues to sheetflow to and offsite regulated watercourse.

5.3.1. Routing – Interim Post-Development Conditions

Table No. 5 lists the post-development uncontrolled flow rates for each catchment under the 25mm to 100-year design storms and Regional Storm.

Table No. 5: Interim Post-Development Uncontrolled Flow Rates

	25 mm (m³/s)	2-Year (m³/s)	5-Year (m³/s)	10-Year (m³/s)	25-Year (m³/s)	50-Year (m³/s)	100-Year (m³/s)	Regional Storm (m³/s)
Catchment 100	1.552	2.700	3.616	4.219	5.040	5.638	6.208	1.584

5.4. Ultimate Post-Development Conditions

For ultimate post-development analysis purposes, the site was modelled as seven (7) drainage catchments. The post-development drainage catchments are shown on Figure 5 and described below. The post-development MIDUSS computer modelling is attached in Appendix C.

Catchment 1000 (31.55 hectares, 80% impervious) represents the majority of the development. Runoff generated from Catchment 1000 will be captured and conveyed to the proposed stormwater management facility via on-site storm sewers.

Catchment 2000 (2.02 hectares, 15% impervious) represents the proposed stormwater management facility. The proposed stormwater management facility is designed to provide the required Enhanced level of protection prior to discharging to the wetland along the northeast limits of the site.

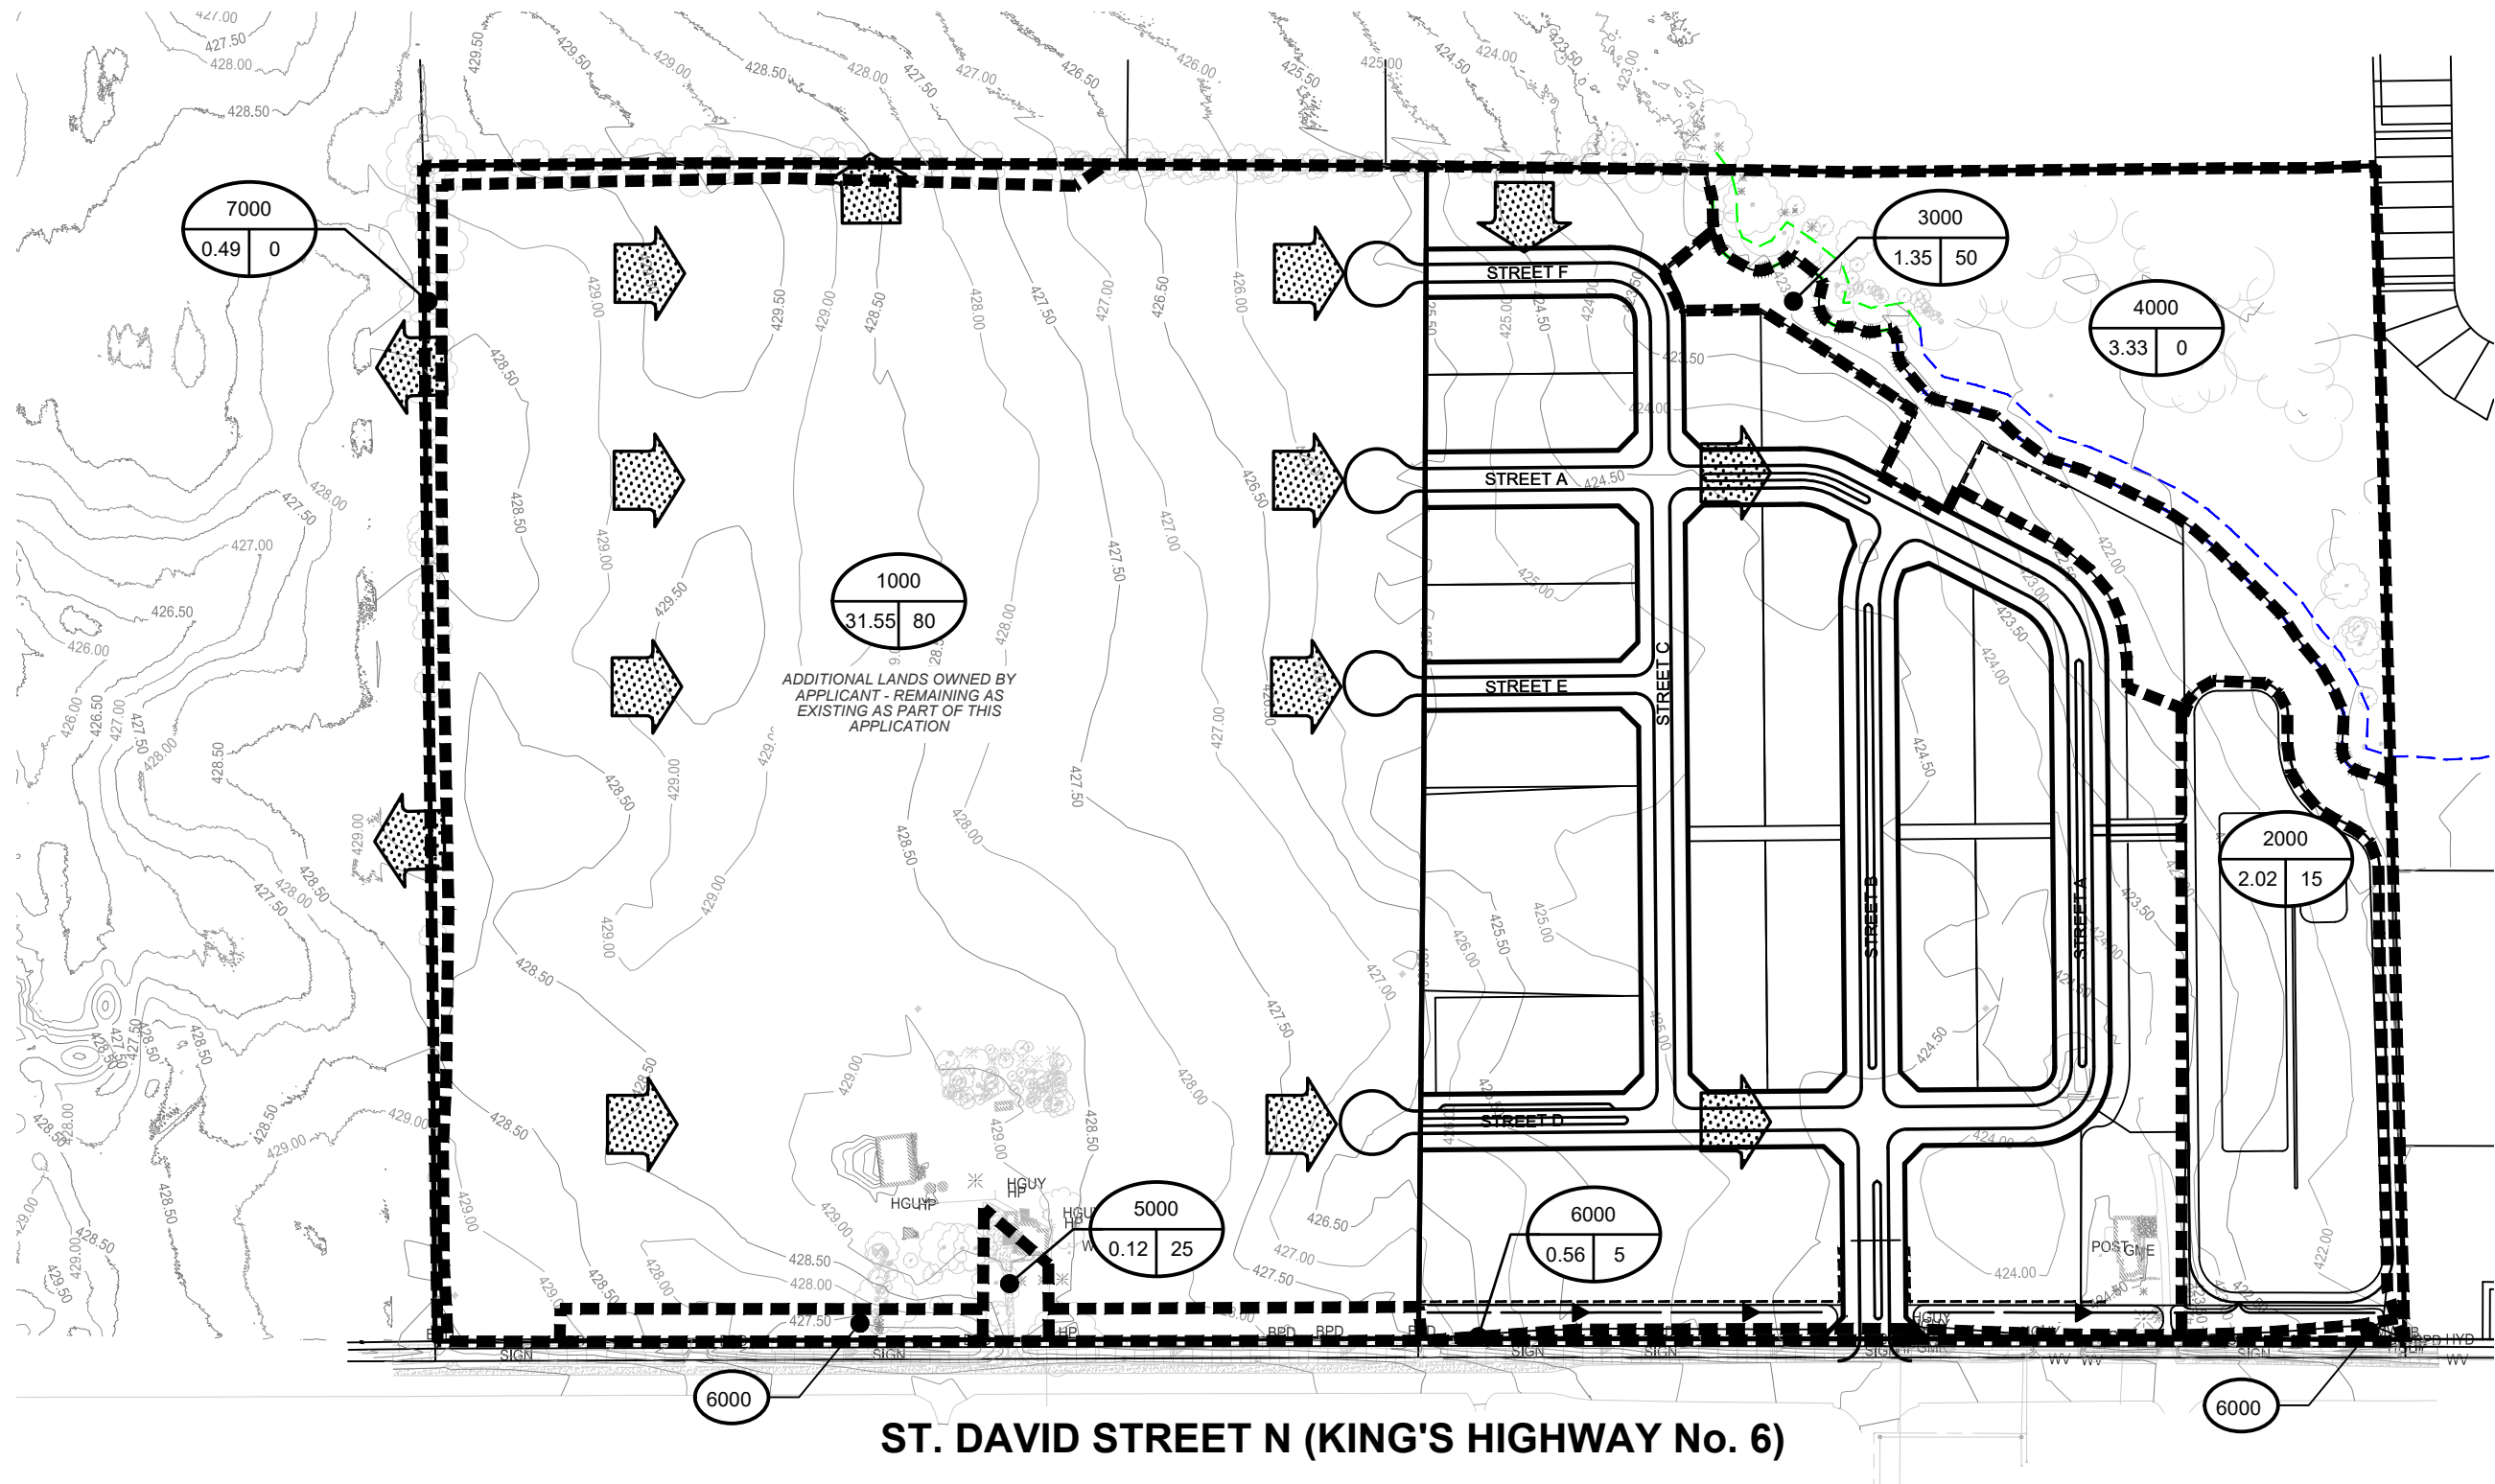

Catchment 3000 (1.35 hectares, 50% impervious) represents a portion of the proposed development adjacent to the northeast wetland. Runoff generated from Catchment 3000 will sheetflow overland, uncontrolled, to the northeast wetland.

Catchment 4000 (3.33 hectares, 0% impervious) represents the northeast portion of the site consisting of an existing wetland. Runoff generated from Catchment 4000 contributes to the wetland extending north and east past the limits of the site.

Catchment 5000 (0.12 hectares, 25% impervious) represents the front yard of the existing houses on site. Runoff generated from Catchment 5000 will sheetflow overland to the roadside ditch on Highway 6 right-of-way, ultimately discharging to a regulated watercourse.

Catchment 6000 (0.56 hectares, 5% impervious) represents a portion of the proposed development adjacent to the Highway 6 right-of-way. Runoff generated from Catchment 6000 will sheetflow overland to the roadside ditch on Highway 6 right-of-way, ultimately discharging to a regulated watercourse.

Catchment 7000 (0.49 hectares, 0% impervious) represents a northwest portion of the proposed development consisting of rooftops and rear yards. Runoff generated from Catchment 7000 will sheetflow overland west to the adjacent farm field, ultimately discharging to an offsite wetland.

50-Year	0.670	935.7	0.300	318.3
100-Year	0.768	1,066.8	0.328	361.6
Regional	0.211	3,007.4	0.078	951.2

Table No. 16: Comparison of Existing and Post-Development Flows - to Northeast Wetland

Design Storm	Existing Conditions (m ³ /s)	Controlled Post-Development Conditions (m ³ /s)
25 mm	0.436	0.132
2-Year	1.519	0.296
5-Year	2.658	0.687
10-Year	3.519	0.907
25-Year	4.835	1.185
50-Year	5.783	1.561
100-Year	6.563	1.866
Regional	3.396	3.807

Table No. 17: Comparison of Existing and Post-Development Flows - to West Farm Field

Design Storm	Existing Conditions (m ³ /s)	Controlled Post-Development (m ³ /s)
25 mm	0.049	0.025
2-Year	0.169	0.082
5-Year	0.317	0.136
10-Year	0.405	0.169
25-Year	0.532	0.210
50-Year	0.633	0.239
100-Year	0.734	0.261
Regional	0.327	0.056

Table No. 18: Comparison of Existing and Post-Development Flows - Totals from the Site

Design Storm	Existing Conditions (m ³ /s)	Uncontrolled Post-Development (m ³ /s)	Controlled Post-Development (m ³ /s)
25 mm	0.561	3.901	0.173
2-Year	1.947	6.995	0.473
5-Year	3.346	9.548	0.755
10-Year	4.608	11.267	0.975
25-Year	6.178	13.566	1.292
50-Year	7.296	15.259	1.643
100-Year	8.263	16.873	1.932
Regional	4.283	4.594	3.902

Therefore, the post-development flow rates discharging from the site during the 2 to 100-year design storm events are less than the existing conditions flow rates from the site. The flow rate during the Regional Storm has increased under post development conditions. The Regional Storm will be conveyed overland through the site at each of the outlet locations summarized in the table above.

Sediment Forebay Design

The proposed stormwater management facility has been designed with one sediment forebay located at the facility inlet. The sediment forebay is 1.0 m deep and has been designed per the Ministry of Environment Stormwater Management Planning and Design Manual guidelines. The full sediment forebay sizing information has been included in Appendix C.

Table No. 19 summarizes the required and provided parameters within the sediment forebay design.

Table No. 19: Sediment Forebay Design Details

Required	Dispersion Length (m)	138.0
	Settling Length (m)	27.3
	Flow Velocity (m/s)	0.15
	Length to Width Ratio	2:1
	Settling Velocity (m/s)	0.0003
Provided	Forebay Length (m)	140
	Flow Velocity (m/s)	0.15
	Length to Width Ratio	5:1

Therefore, the sediment forebays have been designed to provide the required dispersion and flow lengths.

Sediment Loading and Cleanout Frequency

Table No. 20 illustrates sediment loading to the sediment forebay as well as the subsequent cleanout frequency required to maintain this system.

Table No. 20: Sediment Loading and Cleanout Frequency – Sediment Forebays

Catchment Area	Imp. (%)	Annual Sediment Loading	TSS Removal	Annual TSS Reduction	Storage Volume	Cleanout Frequency
33.57 ha	76%	104.1 m ³ (based on 3.1 m ³ /ha)	80%	83.3 m ³	292 m ³ (1/3 of forebay)	~ 3.5 years

Sediment loadings obtained from Table 6.3 of the MOE Stormwater Management Planning and Design Manual, 2003 and prorated based on catchment percent impervious.

Therefore, it is estimated that the sediment forebay will require cleaning every 3 years.

Thermal Mitigation

The proposed stormwater management facility has been designed to function as a wetland complete with a reverse draw from the deep pool portion of the facility. The reverse draw has been designed for the 4-hour 25 mm storm event to allow cooler water to be discharged from the facility under the quality storm event per the Stormwater Management Planning and Design Manual guidelines. The reverse draw outlet consists of a 200 mm diameter pipe with an obvert depth of 1.2 m below the permanent pool elevation and a deep pool bottom depth of 0.9 m below the reverse draw outlet to allow for permanent pool sediment build-up and 0.5 m freeboard from the sediment level per the criteria set out in the Data Synthesis and Design Considerations for Stormwater Thermal Mitigations Measures.

In addition to the reverse draw from the deep pool portion of the proposed stormwater management facility, it is recommended that the landscape design of the facility includes plantings along the permanent pool, outlet structure and banks that help shade the facility and mitigate the thermal impacts of the development.

Major Flow Conveyance

The anticipated major flows on the right-of-way are the 100-year inflows to the stormwater management facility minus the runoff that will be captured and conveyed by on-site storm sewers, which have been designed for the 5-year design storm event, to the stormwater management facility. The major overland flows are then approximately $6.128 \text{ m}^3/\text{s}$ ($14.628 \text{ m}^3/\text{s} - 8.500 \text{ m}^3/\text{s}$) and split evenly into two directions ($3.064 \text{ m}^3/\text{s}$) through the subdivision until the access path to the stormwater management facility. The proposed 23m right-of-way, with standard barrier curb and gutter and 2% crossfall has a conveyance capacity of approximately $3.827 \text{ m}^3/\text{s}$ at a longitudinal grade of 0.6%. Therefore, the proposed right-of-way has sufficient capacity to convey major flows to the proposed stormwater management facility. The major flow conveyance modelling has been included in Appendix C.

6. Infiltration Assessment

As described in the Preliminary Hydrogeological Investigation (Chung and Vander Doelen Engineering, dated January 31, 2025), the existing conditions recharge rate for the area of proposed development is approximately 57,862 m³/yr (see Table No. 21). An enhanced infiltration system is proposed on site to mitigate the difference between existing and post-development condition infiltration volumes. The enhanced infiltration system will consist of rear lot infiltration galleries designed to infiltrate the 25mm storm event from the proposed building rooftops. The enhanced infiltration calculations in Table Nos. 21 to 27 assume that only the back half of the roof area from a townhome unit can be captured and infiltrated while for a single detached lot, the entire roof area is captured and infiltrated. For the medium density blocks, it has been assumed that 25% of the block area is available for infiltration. Therefore the analysis calculates the roof area and the size of each infiltration gallery based on the different lot widths proposed for the subdivision. With the enhanced infiltration system, the proposed development will meet 103% of the recharge rate from existing conditions.

Infiltration gallery drawdown time has been calculated based on an average infiltration rate of 15 mm/hr as noted in the Geotechnical Investigation prepared by Chung and Vander Doelen Engineering (dated February 6, 2025). The average drawdown time of the infiltration galleries is estimated at 22 hours. The contributing runoff was then compared to the number of times the infiltration galleries could be filled with runoff (i.e. runoff available and available capacity to infiltrate) and a safety factor of 0.85 was applied to the resulting runoff depth each month.

As part of the detail design stage, once Draft Plan approval has been granted, we will conduct the required Guelph Permeameter Testing to confirm the in-situ infiltration rates as required by the Stormwater Management Planning and Design Guide.

7. Sediment and Erosion Control Plan

Primary sediment control will be achieved with the installation of heavy duty sediment fencing around the property boundary. The silt fence will eliminate the opportunity for water borne sediments to be transported from the site.

Temporary rock check dams will be installed in rear and side yard swales after the initial grading has been completed to slow the flow rates and promote the settlement of waterborne sediments before they reach the silt fences and the stormwater management facility.

Upon completion of the grading, any area not subject to active construction within 30 days will be topsoiled and seeded as per OPSS 572.

The stormwater management facility will be graded and shaped at the start of any construction or pre-grading activity and act as a sediment pond. Per the Erosion and Sediment Control Guide for Urban Construction (CVC), a sediment pond should be designed with $125 \text{ m}^3/\text{ha}$ of permanent pool volume. For the maximum contributing area of 35.97 ha (given grading constraints), the required permanent pool volume is $4,496 \text{ m}^3$. The stormwater management facility will provide $4,080 \text{ m}^3$ of permanent pool. A silt fence will be placed around the outlet structures to restrict the movement of sediment.

Once catch basins have been installed, the grates will be wrapped in filter cloth. This will be maintained until all building and landscaping has been completed.

Inspection and maintenance of all silt fencing and the sediment pond will start after installation is complete. These features will be inspected on a weekly basis or after a rainfall event of 13 mm or greater. Maintenance will be carried out, within 48 hours, on any part of the facility found to need repair.

Once construction has been substantially completed, the silt fence will be removed from within the pond, any accumulated sediment will be removed and the landscaping and planting of the stormwater management facility will be completed.

After construction of the complete development, erosion will not occur and sediment transport will be minimal. The stormwater management facility will provide all sediment removal.

8. Maintenance Plan

To ensure that the stormwater management system continues to function as designed and constructed, we recommend that the following inspections and maintenance activities be completed on an annual basis:

1. Is there any indication of a spill (i.e. frothy water, oily sheen on the water)? If yes, investigate, inform the appropriate agencies and complete the necessary clean-up and restoration.
2. Inspect the orifice plates. Remove and dispose of any accumulated sediment, trash/litter, debris (i.e. sediment, garbage, leaves, etc.).
3. Inspect all catch basins and manholes. Remove and dispose of any accumulated sediment, trash/litter, debris (i.e. sediment, garbage, leaves, etc.).
4. Inspect all swales and overflow locations. Remove and dispose of any accumulated sediment, trash/litter, debris (i.e. sediment, garbage, leaves, etc.).

Please note that any structures identified during the annual inspection to be worn, missing or damaged are to be repaired or replaced within 48 hours.

9. Conclusions

In summary, the features of the design for the proposed development are as follows:

- 1) Sanitary service for the site will be provided by extending a sanitary sewer west along St. David Street N (Highway No. 6) to the site entrance. Internal sanitary sewers will then be extended throughout the site via the municipal rights-of-way to provide sanitary servicing for the proposed development.
- 2) Water servicing for the site will be provided by extending a watermain west along St. David Street N (Highway No. 6) to the site entrance. An internal watermain will then be extended throughout the site via the municipal rights-of-way to provide water service for the proposed development. Watermain sizing is to be confirmed at the detail design stage.
- 3) Storm sewers will be sized at the detailed design stage to convey the 5-year design storm event to the proposed stormwater management facility. Major overland flows will be directed towards the municipal rights-of-way to the proposed stormwater management facility.
- 4) The proposed stormwater management facility is designed to function as a wetland with 0.3 m deep permanent pool and forebay to provide an Enhanced level of quality control (80% Total Suspended Solid removal).
- 5) The post-development flow rates discharging from the site during the 2 to 100-year design storm events are less than the existing conditions flow rates from the site. The Regional Storm is conveyed overland through the site.
- 6) Infiltration galleries sized to infiltrate the 25 mm design storm event from building rooftops will be implemented in rear yard areas of the proposed lots to meet the infiltration requirements for the site.
- 7) The stormwater management systems meet the current Provincial and Municipal guidelines.
- 8) The principles of “Stormwater Management Practices”, the Ministry of Environment Stormwater Management Planning and Design Manual 2003 have been used in the design of the stormwater management system.

Attention: Mr. Mike Puopolo

RE: Geotechnical Investigation
Proposed Polocorp Fergus Subdivision – Phase 1
968 St. David Street North, Fergus, Ontario

We take pleasure in enclosing one (1) copy of our Geotechnical Investigation Report prepared for the above-referenced site.

If you have any questions or clarifications are required, please contact the undersigned at your convenience.

We thank you for giving us this opportunity to be of service to you.

Yours truly,
CHUNG & VANDER DOELEN ENGINEERING LTD.

Eric Y. Chung, M.Eng., P.Eng.
Principal Engineer

1.0 INTRODUCTION

CHUNG & VANDER DOELEN ENGINEERING LTD. has been retained by PoloCorp Inc. to conduct a geotechnical investigation for the proposed Phase 1 development of the Polocorp Fergus Subdivision to be located at 968 St. David Street North in Fergus, Ontario. It is planned that the development will eventually expand to potentially include the fields directly north of the site as part of the Phase 2 development; however, this report will only consider the portion of the geotechnical investigation completed on the Phase 1 lands.

It is understood that the 19.39± ha site currently being used for agricultural purposes will be developed into a residential subdivision comprised of a combination of residential single units, stacked townhouses, mixed-use units, roadways, a stormwater management facility, and a park. The proposed residential subdivision will be fully serviced with municipal water and sanitary sewer services.

According to the Draft Plan of Subdivision (Polocorp Inc., December 10, 2024), as provided in Appendix B, Phase 1 of the Polocorp Fergus Subdivision will include the construction of a 2.41± ha sized stormwater management (SWM) facility, designated as Block 23, within the southwest corner of the property and a roadway network throughout the subdivision connected to St. David Street North. Other characteristics of the future development are to include a 0.81± ha sized park (Block 25) and a 3.34± ha sized environmental feature and buffer. The existing residential dwelling located at 968 St. David Street North will be incorporated into the proposed residential subdivision (Block 22).

As of the writing of this report, no site grading plan has been provided. CVD will be pleased to review the final design and site grading plan once they are made available.

The purpose of this investigation was to determine the subsurface soil and groundwater conditions at the site and, based on the findings, to make geotechnical recommendations for:

- Site grading operations and engineered fill construction;
- Excavation conditions;
- Groundwater control during construction;
- Foundation bearing pressures;
- Foundation soil classification for seismic design per OBC 2024;
- Site servicing;
- Pavement design and construction; and
- Estimates of infiltration rates of encountered soil deposits.

This geotechnical report should be read in conjunction with CVD's Phase 1 Preliminary Hydrogeological Investigation Report (January 2025).

2.0 FIELD AND LABORATORY WORK

Five (5) boreholes were advanced to depths of between 5.20 and 8.25 m below existing grade, and monitoring wells were installed at each borehole location (labelled Boreholes 4 to 8), between January 15 to 17, 2024. A supplemental investigation was completed, between September 9 and 12, 2024, during which eight (8) additional boreholes/monitoring wells (labelled Boreholes 106 to 113) were drilled and installed to a depth of 6.55 m below grade. The borehole/monitoring well locations are illustrated on the Borehole Location Plan, Drawing No. 1, which is included in Appendix B.

The field investigation program was conducted under the supervision of a member of our engineering team, who logged the subsurface conditions encountered at the boreholes, effected the subsurface sampling and testing, and monitored the groundwater conditions. The boreholes were advanced using a track-mounted drilling rig, supplied, and operated by a specialized contractor. The drill rig was equipped with continuous flight augers and standard soil sampling equipment. Underground utilities were located prior to commencing the field work program.

The investigation was completed using a track-mounted CME-55 drill rig, equipped with standard 83 mm inner diameter hollow stem augers (HSA) operated by Davis Drilling Ltd. of Milton, Ontario. Standard penetration tests (SPTs) in accordance with ASTM Specification D1586, were carried out at frequent intervals of depth, and the results are shown on the Borehole Logs as Penetration Resistance or “N”-values. The undrained shear strength of the cohesive soil deposits was determined on the slightly disturbed SPT samples using a field pocket penetrometer. The compactness condition or consistency of the soil strata has been inferred from the test results.

Soil samples collected during the borehole investigation program were examined in the field and subsequently brought to CVD’s laboratory for tactile examination to confirm field classification. Moisture content determination on all retrieved soil samples was performed.

The borehole location, temporary benchmark, and associated ground surface elevations were surveyed by CVD for the purpose of this report using a Network RTK Global Navigation Satellite System (GNSS) Receiver. The survey data was collected using The UTM Zone 17N Projection, NAD83(CSRS)v7-2010 datum and Canada Geoid Model HT2_2010v70 (CGVD28).

The referenced temporary benchmark (TBM) is described below:

TBM:	Top of fire hydrant nut, south of northern driveway entrance to 968 St. David Street North, as shown on Drawing No. 1
Elevation:	425.17 m (Geodetic)

3.0 EXISTING SITE CONDITIONS

The property is bound by St. David Street North to the west and predominantly by agricultural lands to the north, east, and south of the subject lands. Occasional commercial properties exist southwest of the site.

The majority of the site is comprised of a cultivated agricultural field. A residential dwelling and its related structures front St. David Street North at the west side of the proposed development, and a small wetland contained mid to large sized trees exists in the southeast corner of the site. An existing residential subdivision is situated directly southeast of the southeastern corner of the site.

Generally, there is gentle decrease in grade across the site in a southeasterly direction in which ground elevations range from $427\pm$ to $420\pm$ m. No major undulations or notable topographical features exist. Ground surface elevations at the borehole locations ranged between 421.01 m to 426.95 m.

4.0 SUBSURFACE CONDITIONS

The detailed subsurface conditions encountered at the thirteen (13) boreholes are presented on the Borehole Log Sheets, Enclosures 4 to 8 & 14 to 21. The following notes are intended to amplify and comment on the subsurface data obtained. The borehole and monitoring well locations are indicated on the Borehole Location Plan, Drawing No. 1, included in Appendix B.

Enclosure A provides explanations of the various soil abbreviations and terms used on the borehole log sheets. The stratigraphic boundaries shown on the borehole logs are inferred from non-continuous sampling conducted during advancement of the borehole drilling procedures and, therefore, represent transitions between soil types rather than exact planes of geologic change. The subsurface conditions will vary between and beyond the borehole locations.

4.1 Topsoil and Peat

Topsoil was encountered at the ground surface of twelve (12) boreholes with measured thicknesses between 180 and 300 mm. The thickness of topsoil could vary between and beyond the borehole locations.

An $800\pm$ mm thick peat deposit was encountered at the ground surface of Borehole 107.

4.2 Fine Granular Deposits

The topsoil was typically underlain by a series of fine granular deposits varying between silt, sandy silt, silty sand, and fine to medium sand, but predominantly composed of fine to medium sand. These deposits generally decrease in thickness from north to south across the property with the deposits extending to depths between at least $8.25\pm$ m (below elevation 417.36 m at Borehole 5) below ground surface (mbgs) to 0.75 mbgs (elevation 421.27 m at Borehole 113). Trace amounts of gravel, occasional

gravelly seams (Boreholes 106 and 109), occasional cobbles, and occasional clayey silt seams/layers (Boreholes 4 and 111) were encountered within the deposit. Boreholes 4, 5, 106, and 108 were terminated within the fine granular deposits.

The results of five (5) grain size distribution analyses from the fine to medium sand in Boreholes 106, 108, and 111 (Enclosures 24, 25, and 27), the sand and silt in Borehole 109 (Enclosure 26), and the silt from Borehole 28 (Enclosure 28) are shown graphically on Enclosures 24 to 28.

The SPT “N”-values measured within the fine granular deposits ranged from 3 to 35 blows per 300 mm of penetration, indicating a variable very loose to dense relative density. Natural moisture contents were measured between 2 and 27%, indicating damp to saturated moisture conditions.

4.3 Clayey Silt Till and Sand and Silt Till

The aforementioned fine granular deposits were underlain by a till deposit varying from a clayey sandy silt till (Boreholes 6 to 8, 107, 109, and 111 to 113) to a sand and silt till (Borehole 110, 112, and 113). Trace to some gravel and occasional silt lenses/seams were encountered within the deposit. Boreholes 6 to 8 were terminated within the till deposit at a depth of 5.20 mbgs, and Boreholes 107 and 109 to 113 were terminated within the till deposit at a depth of 6.55 mbgs.

The SPT “N”-values measured within the till deposit ranged from 8 to 69 blows per 300 mm of penetration with the sand and silt till generally having a relative density varying from compact to very dense.

The undrained shear strength obtained on the retrieved cohesive clayey silt till samples was measured from 25 to greater than 250 kPa. Based on the above test results and the tactile examination, the clayey silt till is considered to have a stiff to hard consistency. Natural moisture contents were measured between 7 and 25%, and the plasticity of the clayey silt till layers was generally observed to be drier than the plastic limit.

4.4 Groundwater

Throughout the field investigation, groundwater conditions were monitored during advancement of boreholes, and water level readings were measured on multiple occasions following the completion of fieldwork in all of the accessible thirteen (13) installed monitoring wells

Groundwater levels were measured at depths ranging between 2.27 (Borehole 5) and 0.25 mbgs (Borehole 8), corresponding to elevations ranging between 423.62 and 420.28 m. The groundwater measurements for each monitoring well collected thus far for the investigation (February to October 2024) are summarized in Table 1 (Appendix D). It is noted that the observed groundwater table will fluctuate seasonally, such as during the spring following the period of peak snow melt, and in response to major weather events. It is possible that peak water levels could be up to 0.5 m higher than those measured in this investigation.

Figure 5, also included in Appendix D, presents an interpretation of the water table configuration and shallow groundwater flow directions across the property using the groundwater elevation measurements gathered on September 18, 2024. The water table mimics the topography of the site with shallow groundwater flowing southerly towards the southeastern portion of the property in the direction of the wetland. Additionally, groundwater appears to also flow into the existing drainage feature located within the southwestern corner of the site.

Well response tests (slug/bail tests) were completed at three (3) of the monitoring well locations (Boreholes 5 to 7) on March 11, 2024, to provide a more accurate estimate of the hydraulic conductivity (K) (or permeability) of the saturated aquifer soil strata. These tests resulted in hydraulic conductivity values ranging from 3×10^{-5} to 9×10^{-5} m/s. These results are graphically presented in Appendix C, and a summary of the data is also included in Table 1 (Appendix D).

These values are consistent with the hydraulic conductivity ranges typically associated with similar soils (Freeze & Cherry, 1979). Hydraulic conductivities calculated using the Hazen Formula from the soil grain size analyses (Enclosures 24 to 28) were similar in magnitude to those of the single well response tests.

5.0 DISCUSSION AND RECOMMENDATIONS

It is understood that the 19.39± ha site currently being used for agricultural purposes will be developed into a residential subdivision comprised of a combination of residential single units, stacked townhouses, mixed-use units, roadways, a stormwater management facility, and a park. The proposed residential subdivision will be fully serviced with municipal water and sanitary sewer services.

According to the Draft Plan of Subdivision (Polocorp Inc., December 10, 2024), as provided in Appendix B, Phase 1 of the Polocorp Fergus Subdivision will include the construction of a 2.41± ha sized stormwater management (SWM) facility, designated as Block 23, within the southwest corner of the property and a roadway network throughout the subdivision connected to St. David Street North. Other characteristics of the future development are to include a 0.81± ha sized park (Block 25) and a 3.34± ha sized environmental feature and buffer. The existing residential dwelling located at 968 St. David Street North will be incorporated into the proposed residential subdivision (Block 22).

In general, the surficial topsoil was underlain by a series of loose to compact fine granular deposits, predominantly comprised of fine to medium sand. These deposits generally decrease in thickness from north to south across the property with the deposits extending to depths between at least 8.25± mbgs (below elevation 417.36 m at Borehole 5) to 0.75 mbgs (elevation 421.27 m at Borehole 113). These fine granular deposits were underlain by stiff to hard clayey silt till and/or compact to dense sand and silt till deposits. Occasional cobbles were encountered within the deposits. Peat deposits can be found in an around the existing wetland.

More extensive loose soil conditions were occasionally encountered in the near surface soils of some of the boreholes (e.g. Boreholes 4 and 5) which are not suitable to support future house foundations in their current condition. Removal of such loose zones and replacement with engineered fill (where necessary) is considered to be a suitable and practical remedy to repair such areas.

Shallow groundwater conditions were encountered at all thirteen (13) borehole locations with the water table measured across all site visits at depths between 2.27 (Borehole 5) and 0.25 mbgs (Borehole 8), corresponding to elevations ranging between 423.62 and 420.28 m. Shallow groundwater flows southerly towards the southeastern portion of the property in the direction of the wetland. Additionally, groundwater appears to also flow into the existing drainage feature located within the southwestern corner of the site. Based on both the single well response tests and grain size analyses, the hydraulic conductivity values for the fine to medium sand deposit were calculated between 3×10^{-5} and 9×10^{-5} m/s.

It is recommended that a permanent groundwater management system (GWMS) be implemented for the development of the subdivision lands to control future groundwater levels and prevent future wet basement problems. Alternatively, the site can be raised to establish basement floor levels at least 0.6 m above high groundwater levels which will be determined through on-going monitoring as part of the CVD hydrogeological study.

Furthermore, it is recommended that any existing below-grade drains, drainage tiles or drainage tile networks be fully understood/investigated to understand how their presence (or removal) would impact the shallow groundwater system and the proposed development.

As of the writing of this report, no site grading plan has been provided. CVD will be pleased to review the final design and site grading plan once they are made available.

5.1 Site Grading and Engineered Fill Construction

As of the writing of this report, no site grading plans have been provided; however, it is anticipated that partial regrading of the site will be conducted using “cut-fill” procedures, and that more extensive “fill” operations will occur. It is recommended to construct engineered fill in areas to be raised in order to suitably support the proposed residential building structures, future roadways, and infrastructure servicing.

Inorganic on-site native soil deposits from “cut” areas may potentially be reused to construct engineered fill capable of supporting future house foundations, roadways, and municipal infrastructure servicing. The natural moisture content of the “cut” soils to be used as engineered fill should be within 3% below their optimum moisture contents in order to achieve the specified degree of compaction.

Topsoil was encountered at the ground surface of twelve (12) of the borehole locations with measured thicknesses ranging between 180± and 300± mm. Additionally, an 800± mm peat deposit was encountered at the ground surface of Borehole 107. It should be noted that the thickness of the organic soil layer could vary drastically across the site from those reported at the borehole locations. It is likely that the site has been regraded to achieve the present condition for farming, and therefore, filling of local depressions may result in fill pockets not detected by the boreholes.

Topsoil stripping operations should be conducted when the ground is not wet and will support large scale construction equipment. Over-stripping can result when the ground conditions are wet and unstable.

Fill and/or loose soil conditions were encountered at all borehole locations and extended up to depths of up to 3.0± m below existing grade. The following table provides the depth and elevation at each borehole location where non-suitable soil conditions were encountered:

Borehole No.	Topsoil Thickness (mm)	Existing Ground Elevation (m)	Thickness of Non-Suitable Soils (m)	Elevation of Suitable Soils (m)
4	300	426.9±	0.8±	426.1±
5	180	425.6±	3.0±	422.6±
6	250	424.5±	1.0±	423.5±
7	230	421.8±	1.0±	420.8±
8	300	421.0±	0.5±	420.5±
106	200	424.8±	0.5±	424.3±

Borehole No.	Topsoil Thickness (mm)	Existing Ground Elevation (m)	Thickness of Non-Suitable Soils (m)	Elevation of Suitable Soils (m)
107	800 - Peat	422.9±	1.0±	421.9±
108	250	424.7±	0.8±	423.9±
109	200	422.7±	0.6±	422.1±
110	300	422.9±	0.8±	422.1±
111	300	421.2±	0.4±	420.8±
112	200	422.3±	0.4±	421.9±
113	250	422.0±	0.9±	421.1±

It should be noted that the elevations of suitable soils shown in the above table may differ from the founding elevations provided for specific bearing capacities in section 5.3. The elevations provided in the above table are located below loose and/or organic/deleterious soils but may not necessarily be located at an elevation sufficient for higher bearing capacities

Approved on-site sand and imported coarse sand and gravel are recommended to be used to construct the engineered fill beneath the footings and floor slabs under controlled and supervised conditions. Reuse of siltier soils (e.g., sandy silt or silt) and cohesive soils should be limited to beneath pavement and landscaped areas.

Any shortfall of fill material required for engineered fill operations may be made with similarly graded imported soils. It is recommended that any proposed borrow source materials be tested prior to importing in order to ensure that the environmental quality of the imported fill meets all environmental approval criteria and to ensure that the natural moisture content of the fill is suitable for compaction. Should similarly graded soils not be able to meet the requirements for use as engineered fill, imported Granular B may be considered for such purposes.

Due to the shallow depth of the water table across the site (0.2± to 2.0± mbgs during the spring), it is recommended that engineered fill construction be conducted during the summer and early fall months when drier warmer weather conditions typically exist as the onsite soils are sensitive to moisture and will become difficult to handle and compact to the specified degree of compaction when wet.

The on-site finer grained and cohesive deposits are considered to be frost-susceptible. Constructing engineered fill, backfilling footings, foundation walls and service trenches using finer-grained soils during the winter months is not advisable, unless suitable weather conditions prevail, the soils are at suitable moisture content, and strict procedures are followed and monitored on a full-time basis by the geotechnical engineer.

The on-site soils are generally susceptible to softening and deformation when exposed to excessive moisture and construction traffic. As a result, it is imperative that the grading/filling operations are

planned and maintained to direct surface water run-off to low points and then be positively drained by suitable means. During periods of wet weather, construction traffic should be directed along the designated construction routes so as not to disturb and rut the exposed subgrade soil. Temporary construction roads consisting of clear crushed material (such as crushed stone or recycled concrete) may be required during poor weather conditions such as wet spring or fall.

The following procedures are recommended for the construction of engineered fill to support future building foundations, roadways, and municipal infrastructure servicing:

1. All topsoil, peat, fill materials, deleterious materials and very loose to loose inorganic native soil should be stripped from building envelope and roadway areas. The inorganic native soil may be carefully segregated and salvaged for potential reuse purposes to construct engineered fill;
2. The exposed subgrade surface should be thoroughly recompactd using large heavy compaction equipment (smooth drum for granular based materials and sheepsfoot for cohesive soils) if it can support such equipment and remaining stable. Careful review and guidance by the geotechnical engineer are recommended should the subgrade become unstable. All prepared subgrade areas are to be inspected by qualified geotechnical personnel prior to placement of fill. Any soft spots encountered during the recompaction process should be excavated to the level of competent soil;
3. The required grades can then be achieved by placing approved inorganic on-site soil or imported fill in maximum 200 to 300 mm thick loose lifts which are to be thoroughly compacted to at least 100% Standard Proctor maximum dry density (SPMDD). The moisture content of the fill materials should be within 3% below their optimum moisture contents in order to achieve the specified degree of compaction;
4. The engineered fill used to support the future building, infrastructure servicing and roadway pavements must be placed such that the fill pad extends horizontally outwards at least a distance equal to the depth of fill to be placed;
5. Inorganic onsite soils may be considered as suitable engineered fill material provided the natural moisture content of the soil is within 3% below the optimum moisture content in order to achieve the specified degree of compaction. Overly wet and organic materials may be placed in non-structural areas and beyond stormwater management areas where 90% SPMDD is considered adequate. Overly wet inorganic soil may potentially be mixed with drier soils to produce a suitable moisture content to allow appropriate compaction to occur;
6. Adequate earth cover must be provided to protect engineered fill from freezing if left over the winter months; and
7. All fill placement and compaction operations must be supervised on a full-time basis by qualified geotechnical personnel to approve fill material and ensure the specified degrees of compaction have been achieved.

Vibration could be generated from various construction equipment during construction, such as compactors and rollers which could be harmful to surrounding structures and buildings. Peak particle

velocity (PPV) of ground motion is widely accepted as the best descriptor of potential for vibration damage to structures. The safe vibration limit can be set to 8 to 25 mm/s PPV, depending on frequency of vibrations and the sensitivity of surrounding structures to vibration.

Due to the relatively isolated location of the site, it is unlikely that any critical or susceptible infrastructure will be affected by the site grading operations. However, if deemed necessary, vibration monitoring can be performed. Vibration monitoring can be carried out to measure the PPV of ground motion from vibration generated from typical compaction equipment at the beginning of the project in potentially critical areas. This will set criteria and establish the type of equipment to be used for this project. It is also recommended that a pre-construction condition survey be conducted to document the condition of the existing structures within the possible zone of influence.

5.2 Site Servicing

The subdivision will be municipally serviced with watermain and sewers. According to the Centre Wellington Development Manual (June 2024), it is anticipated that municipal servicing will generally lie $1.2\pm$ to $2.4\pm$ m below finished grades. The sanitary sewer obvert should be located a minimum of 2.4 m below final road grade, the storm sewer obvert should be located 1.2 m below final road grade and adequately compacted, and the top of the watermain pipe should be located 2.0 m below finished grade.

5.2.1 Groundwater Control and Open Cut Excavation

Excavations are expected to be in the order of $1\pm$ to $3.5\pm$ m deep for foundations and site servicing. The excavations will penetrate topsoil, potentially peat/organics, native loose to compact fine granular deposits, and native stiff to hard clayey silt till and/or compact to very dense sand and silt till. Provided the groundwater is controlled/lowered below the excavation depths, these materials are considered to be Type 3 Soils in accordance with the latest Occupational Health and Safety Act.

Above the groundwater table, uncontrollable groundwater is not expected within the anticipated depths of excavation, and excavations in the Type 3 Soils are expected to remain stable during the construction period provided that side slopes are cut to 1H : 1V from the bottom of the excavation. Where seepage or perched groundwater is encountered, side slopes should be cut to more stable angles of 3H : 1V. The side slopes should be suitably protected from erosion processes. Surface run-off which inadvertently enters the excavation can be controlled by using conventional filtered sump pumping techniques, as and where required.

Even though a site grading plan has not yet been provided, it is expected that groundwater control will be required for at least some of the footing excavations since excavations will be carried out below the groundwater table within the higher conductive fine granular soils (hydraulic conductivity ranging from 3×10^{-5} to 9×10^{-5} m/s), and the fine granular soils will become “quick” and lose their integrity to support loads. The groundwater level must be lowered and controlled to at least 600 mm below the excavation level to facilitate excavation and construction of footings and floor slabs.

Depending on whether the excavation is conducted in an area where the water table is located below the fine granular deposits within the clayey silt till or sand and silt till, it may be possible to control by pumping from filtered sump pits (possibly together with drainage ditches and intercept ditches). It is recommended that CVD be retained to review the design grades and evaluate the need for dewatering. Depending on the depth of sewer and footing excavation below the groundwater table, well-point dewatering could be required to pre-drain the fine granular soil prior to excavation.

In wet to saturated subgrade conditions, it will be necessary to excavate below founding level and pour a 50 to 75 mm thick mud slab of lean concrete to protect the founding soil from disturbance during the installation of reinforcing steel bars and form work.

5.2.2 Pipe Bedding

Any loose, unstable and/or organic soils encountered at the pipe invert should be sub-excavated and replaced with well compacted Granular "A" which should be placed in 150 mm thick layers and compacted to at least 95% Standard Proctor Maximum Dry Density (SPMDD). The support of pipes in these areas can also be achieved with non-shrinkable fill if poor soil is encountered at the subgrade level and fully removed.

The bedding requirements for the services should be in accordance with both the Ontario Provincial Standard Drawings OPSD - 802 for flexible and rigid pipes. The bedding shall be a Class "B" and consist of at least 150 mm thick Granular "A" compacted to at least 95% SPMDD. Granular "A" should be used to backfill around the pipe to at least 150 mm above the top of the pipe.

Particular attention should be given to ensure material placed beneath the haunches of the pipe is adequately compacted. Recycled asphalt will not be allowed to be used in Granular "A" bedding material.

5.2.3 Trench Backfill

Excavated inorganic materials are considered suitable for reuse as trench backfill. If necessary, potential mixing of drier and wetter excavated soils in proper ratios can be done to produce a suitable mixture near the material's optimum moisture content in order to achieve the required compaction specification. Conversely, judicious addition of water may be required if the soils are significantly drier than their optimum moisture content in order to facilitate suitable compaction.

The backfill should be placed in thin layers, 200 to 300 mm thick or less dependant on the demonstrated success of compaction based on in-situ density test results. Other types of materials such as organic soils, overly wet soils, boulders, and frozen materials (if work is carried out in the winter months) should not be used for backfilling. All backfill should be compacted to at least 95% SPMDD.

Backfilling operations should follow closely after excavation so that only a minimal length of trench slope is exposed at any one time so as to minimize potential problems. This will potentially minimize over-wetting of the subgrade material. Particular attention should be given to make sure frozen

material is not used as backfill should construction extend into the winter season.

Regarding the clayey silt till deposits, it has been our experience that excavated cohesive soils should be broken into smaller pieces (less than 150 mm diameter) before returning into the trench as backfill. This will eliminate “wedging” problems and reduce long term settlement. Particular attention must be made to backfilling the laterals where the trenches are narrow and against the manholes and catch-basins. Thinner lifts and additional compaction must be applied.

Frequent inspection by experienced geotechnical personnel should be carried out to examine and approve backfill material, to carefully inspect placement, and to verify that the specified degree of compaction has been obtained by in situ density testing.

5.3 Footing Foundations

Conventional strip and spread footing foundations can be used to support the proposed buildings of the proposed residential subdivision; it should be noted that this current geotechnical investigation is insufficient and not intended for detailed building design purposes.

Depending on the final design and size of the proposed medium density blocks (Block 19 and 20) and other larger structures, it will be necessary to conduct a geotechnical investigation at those lots in order to provide a detailed, site and project specific report for the design and construction of the proposed development.

Based on the thirteen (13) widely spaced boreholes, footings cast on native competent stiff to hard clayey silt till, compact to dense sand and silt till, or compact fine granular deposits can be designed using net Geotechnical Reactions at SLS and Factored Geotechnical Resistances at ULS as provided in the following table which summarizes the highest founding level and elevation for the footing at the relevant borehole locations:

Borehole No.	Existing Ground Elevation (m)	Highest Founding Depth (m)	Highest Founding Elevation (m)
SLS = 100 kPa; ULS = 150 kPa			
4	426.94	0.94	426.00±
5	425.61	3.01	422.60±
107	422.93	1.03	421.90±
109	422.66	0.86	421.80±
SLS = 150 kPa; ULS = 250 kPa			
6	424.53	1.03	423.50±
7	421.82	1.02	420.80±

Borehole No.	Existing Ground Elevation (m)	Highest Founding Depth (m)	Highest Founding Elevation (m)
8	421.01	1.11	419.90±
106	424.80	0.90	423.90±
108	424.74	0.84	423.90±
110	422.92	0.82	422.10±
111	421.24	0.64	420.60±
112	422.30	0.50	421.80±
113	422.02	0.92	421.10±

Higher soil bearing capacities may be available for footings founded at elevations lower than those cited above, through a site and project specific geotechnical evaluation.

Footings founded on approved engineered fill can be designed to a net Geotechnical Reaction of 150 kPa at SLS and Factored Geotechnical Resistance of 250 kPa at ULS.

These soil bearing pressures can be achieved provided that the founding subgrade is undisturbed during construction. The majority of the settlements will take place during construction and the first loading cycle of the building. In addition, the footings should be founded below any topsoil, fill, or other deleterious materials on competent undisturbed soils. Spacing between adjacent footing steps should not be steeper than 10H to 7V.

It should be noted that due to the relatively high groundwater table (elevations 420.20± to 423.60± m), unless engineered fill (see Section 5.1) is used to raise the grade, the majority of the footing excavations are anticipated to contact wet to saturated fine granular soils. To this end, it is recommended that a 50 to 75 mm thick protective concrete slab should be poured and allowed to set on the prepared subgrade to further protect it from disturbance by construction traffic and the elements. Basements should be suitably founded at least 0.6 m above the high groundwater table. A permanent groundwater management system (GWMS) could be utilized to control future groundwater levels and prevent future wet basement problems.

Exterior footings and footings in unheated portions of the building should be provided with a soil cover of not less than 1.2 m or equivalent synthetic thermal insulation for adequate frost protection. The founding subgrade soils must be protected from frost penetration during winter construction.

The footing excavations should be inspected by the geotechnical engineer to ensure adequate soil bearing and proper subgrade preparation.

5.4 Lateral Earth Pressure

House basement walls and other soil retaining structures should be designed to resist the lateral earth pressure acting against these walls. The following formula may be used for these calculations. The following formula may be used to calculate the unfactored earth pressure distribution. The factored resistance can be calculated by using a factor of 0.8.

$$P = K (\gamma H + q)$$

where:

P =	Lateral earth pressure	kPa
K =	earth pressure coefficient, 0.5 for non-yielding foundation wall earth pressure coefficient, 0.3 for yielding retaining wall	
γ =	unit weight of granular backfill, compacted to 95% SPMDD	21 kN/m ³
H =	unbalanced height of wall	m
q =	surcharge load at ground surface	kPa

The backfill for the foundation walls and retaining walls should be free-draining granular materials which should have less than 8% silt particles (OPSS Granular “B” Type I). The backfill should be placed in thin layers and compacted to 95% SPMDD. Over-compaction adjacent to the foundation/retaining walls should be avoided. Compaction should be carried out with hand operated equipment within 1 m of the foundation wall or retaining wall. Weeping tiles leading to a frost-free outlet or weep holes should be installed to effect drainage behind the retaining wall.

The sliding resistance of the retaining wall footings should be checked. The unfactored horizontal resistance against sliding between cast-in-place concrete and the various soils can be calculated using the following unit weight and friction coefficient:

Soil	Unit Weight (kN/m ³)	Friction Coefficient
Well-Compacted Granular Backfill	21	0.45
Fine to Medium Sand	20	0.35
Silt	19	0.30
Clayey Silt Till and Sand and Silt Till	20	0.40

It should be noted that the soils encountered during the investigation were variable in composition and are not all are considered to be free-draining materials (i.e., clayey silt till). A drainage core layer should be installed against basement walls in accordance with OBC requirements. The basement walls should be damp-proofed.

A perimeter drainage system is required to ensure hydrostatic pressure does not build up in the backfill against the foundation wall. The perimeter weeping tile system is to be installed at the base of the footing to direct the collected waters to sump pump installations or the storm sewer.

5.5 Earthquake Considerations

In accordance with The Ontario Building Code 2024 (OBC), the proposed structure should be designed to resist earthquake load and effects as per OBC Subsection 4.1.8.

Based on the condition of the underlying soil encountered at the boreholes, and the fact that any loose/soft soils will be removed, and our experience with the local soil conditions up to a depth of 30 m, the site can be overall be classified as **Site Class D** as per OBC Table 4.1.8.4B.

5.6 Pavement Design

The earth subgrade soil is generally expected to consist of fine granular deposits (sand, silt) and cohesive clayey silt till soils. Cognizant of the traffic volume and the subgrade soils, the following pavement component thicknesses (per Centre Wellington Development Manual, June 2024) are considered suitable for industrial roads:

Pavement Component	Local Road Component Thickness (mm)	Collector Road Component Thickness (mm)
HL3 Surface Asphaltic Concrete	40	50
HL4 Binder Asphaltic Concrete	50	60
Granular “A” Base Course	150	150
Granular “B” Type II Sub-base Course	450	600
Granular Base Equivalency (GBE)	630	770

Note: GBE denotes Granular Base Equivalency which is calculated using factors of 2 for asphaltic concrete, 1 for Granular “A” base and 0.67 for Granular “B” sub-base

The pavement design considers that road construction will be carried out during the drier time of the year and that the subgrade is stable, not heaving under construction equipment traffic. If the subgrade is wet or unstable, additional granular sub-base may be required.

The subgrade should be prepared in accordance with the recommendations provided in Sections 5.1 and 5.2 prior to placement of the granular base layers.

The base and sub-base materials should be produced in accordance with the current OPSS specifications and placed and uniformly compacted to at least 100% SPMD. The asphaltic concrete should be placed and compacted in accordance with OPSS Form 310 and to a minimum of 92% of the Marshall Density

(MRD). Frequent in-situ density testing by this office should be carried out to verify that the specified degree of compaction is being achieved and maintained.

SS-1 or SS-1HH tack coat should be applied to all binder course surfaces and vertical surfaces (i.e., curbs, pavement joints, etc.) prior to placement of asphalt. Refer to OPSS 310 and OPSS 1101 for additional details.

It should be noted that even well compacted trench backfill could settle for a period of time after construction. In this regard, the surface course of the asphaltic concrete should be placed at least one (1) year after trench backfill is completed so as to allow any minor settlements to occur within the trench backfill. The incomplete pavement structure may not be capable of supporting construction traffic. Consequently, minor repairs of the sub-base, base and asphaltic concrete may be required prior to paving with the base course and/or the surface course asphaltic concrete.

Due to the relatively high low depth of the wet to saturated soil conditions found throughout the site ($0.2\pm$ to $2.3\pm$ mbgs), longitudinal sub-drains with positive drainage outlets are recommended to be installed at the subgrade level along the edges of the roadway construction to enhance the performance of the pavement.

Positive drainage outlets should be provided at all low points of the prepared earth subgrade, such as stub drains extended from the catch-basins. Systematic drainage of the granular base materials will promote the longevity of the pavement structure. The prepared earth subgrade and final pavement surfaces should be graded to direct water runoff away from buildings, sidewalks, and other similar pertinent structures. The roadway subgrade should be free of depressions and should have a 2% slope from the crown to the edge of the pavement.

5.7 Infiltration Rates of On-Site Soils

It is understood that a stormwater management (SWM) facility is planned to be constructed in the southwestern corner of the site (Block 23). If an infiltration feature is to be included in the development of the property, it should be located below the footing drain/weeper and at least 5 m away from the proposed building footprints. Additionally, the infiltration features should have the base located at least 1.0 m above the groundwater table, and a minimum infiltration rate of 15 mm/hr is required.

Based on the results of grain size analyses and our experience, the hydraulic conductivity and infiltration rate of the native inorganic soil types encountered at the boreholes are estimated and provided in the following table and may be used for storm water management purposes:

Material	Hydraulic Conductivity (K) (cm/sec)	Infiltration Rate (mm/hr)
Fine to Medium Sand (Enclosures 24, 25, and 27)	3×10^{-3} to 9×10^{-3}	75 to 150
Sandy Silt to Sand and Silt (Enclosure 26)	3×10^{-5} to 1×10^{-4}	10 to 20
Silt (Enclosure 28)	1×10^{-5}	3 to 5
Clayey Silt Till	1×10^{-6}	<1

Due to the predominantly clayey silt till soils (Boreholes 7, 112, and 113), and the high water table in the area (depths of $0.2\pm$ to $1.6\pm$ mbgs, corresponding to elevation between $420.8\pm$ and $421.6\pm$ m across all seasons), the SWM facility might need to be either raised sufficiently above the water table or redesigned to be feasible.

5.8 Handling of Excess Soils

Excess soil may be generated and removed off-site during the construction activities associated with the proposed site works. The management of excess soil is now governed by O.Reg. 406/19, MECP document entitled “On-Site and Excess Soil Management Regulation”. In accordance with the regulation, the Project Leader is responsible for the handling, storage, reuse, transportation, and removal of all soil. To support off-site removal of excess soil, the following is required:

- Planning Documentation
 - Assessment of Past Use
 - Sampling and Analysis Plan
 - Excess Soil Characterization Report
 - Excess Soil Destination Report
- Tracking
- Registry
- Record Keeping

No testing was conducted during this geotechnical investigation; however, soil sampling and analysis may be required as per the above-noted MECP document and/or as per the requirement of the receiving site owner(s), depending on the volume of excess soil generated during construction. The analytical results and environmental assessment findings must be disclosed to the receiving site owner(s) and approval by the receiving site owner(s) be obtained prior to exporting/transferring the materials.

If any impacted soils are discovered during construction, CVD should be contacted for sampling and testing to determine the limit of the impacted soils.

6.0 CLOSURE

The Limitations of Report, as quoted in Appendix A, is an integral part of this report.

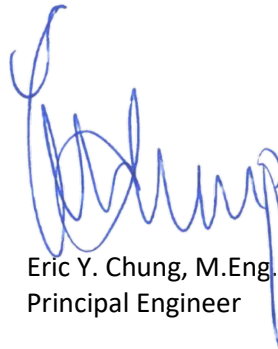

We trust that the information presented in this report is complete within our terms of reference. If there are any further questions concerning this report, please do not hesitate to contact our office.

Yours truly,

CHUNG & VANDER DOELEN ENGINEERING LTD.

APPENDIX A

LIMITATIONS OF REPORT

APPENDIX “A”

LIMITATIONS OF REPORT

The conclusions and recommendations given in this report are based on information determined at the testhole locations. Subsurface and groundwater conditions between and beyond the testholes may differ from those encountered at the testhole locations, and conditions may become apparent during construction which could not be detected or anticipated at the time of the site investigation. It is recommended practice that the Soils Engineer be retained during construction to confirm that the subsurface conditions throughout the site do not deviate materially from those encountered in the testholes.

The comments made in this report on potential construction problems and possible methods are intended only for the guidance of the designer. The number of testholes and their respective depths may not be sufficient to determine all the factors that may affect construction methods and costs. For example, the thickness of surficial topsoil or fill layers may vary markedly and unpredictably. The contractors bidding on this project or undertaking the construction should, therefore, make their own interpretation of the factual information presented and draw their own conclusion as to how the subsurface conditions may affect their work.

The benchmark and elevations mentioned in this report were obtained strictly for use in the geotechnical design of the project and by this office only, and should not be used by any other parties for any other purposes.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. CHUNG & VANDER DOELEN ENGINEERING LIMITED accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

The design recommendations given in this report are applicable only to the project described in the text and then only if constructed substantially in accordance with the details stated in this report. Since all details of the design may not be known, we recommend that we be retained during the final design stage to verify that the design is consistent with our recommendations, and that assumptions made in our analysis are valid.

This report does not reflect the environmental issues or concerns unless otherwise stated in the report.

- Notes:
- 1) All Elevations Referenced to Geodetic Survey by CVD.
 - 2) Bolded elevations represent the maximum water table aquifer elevation measured at each monitoring well throughout all seasons.
 - 3) Negative water level indicates that water level is above ground.
 - 4) : Monitoring well/piezometer dry
 - 5) Negative fluctuation indicates drop in water level relative to baseline.

ENCLOSURES

Soil Abbreviations and Terms Used on Record of Borehole Sheets

TERMINOLOGY DESCRIBING COMMON SOIL TYPES:

Topsoil	-	mixture of soil and humus capable of supporting vegetation
Peat	-	mixture of visible and invisible fragments of decayed organic matter
Till	-	unstratified glacial deposit which may range from clay to boulders
Fill	-	soil materials identified as being placed anthropologically

CLASSIFICATION (UNIFIED SYSTEM)

Clay	<0.002mm
Silt	0.002 to .075mm
Sand	0.075 to 4.75mm
	Fine 0.075 to 0.425 mm
	Medium 0.425 to 2.0 mm
	Coarse 2.0 to 4.75 mm
Gravel	4.75 to 75mm
	Fine 4.75 to 19 mm
	Coarse 19 to 75 mm
Cobbles	75 to 300mm
Boulders	>300mm

TERMINOLOGY

Soil Composition	% by Weight
"traces"	<10%
"some"(eg. some silt)	10-20%
Adjective (eg. sandy)	20-35%
"and"(eg. sand and gravel)	35-50%

Standard Penetration Resistance (SPT): Standard Penetration Resistance ('N' Values) refers to the number of blows required to advance a standard (ASTM D1586) 51 mm Ø (2 inch) split-spoon sampler by the use of a free falling, 63.5 Kg (140lbs) hammer. The number of blows from the drop weight is recorded for every 15 cm (6 inches). The hammer is dropped from a distance of 0.76m (30 inches) providing 474.5 Joules per blow. When the sampler is driven a total of 45 cm (18 inches) into the soil, the standard penetration index ('N' Value) is the total number of blows for the last 30 cm (12 inches).

Dynamic Cone Penetration Resistance (DCPT): Dynamic Cone Penetration Resistance is similar to a SPT with the 474.5 Joule/blow impulse provided by the free falling hammer where the split-spoon sampler is replaced by a 51 mm Ø, 60° conical point and the number of blows is recorded continuously for every 30 cm (12 inches).

COHESIVE SOILS CONSISTENCY

	(kPa)	(P.S.F.)	Nominal 'N' Value
Very Soft	<12	<250	0-2
Soft	12-25	250-500	2-4
Firm	25-50	500-1000	4-8
Stiff	50-100	1000-2000	8-15
Very Stiff	100-200	2000-4000	15-30
Hard	>200	>4000	>30

RELATIVE DENSITY OF COHESIONLESS SOIL

	'N' Value
Very Loose	0-4
Loose	4-10
Compact	10-30
Dense	30-50
Very Dense	>50

MOISTURE CONDITIONS:

Cohesive Soil
DTPL- Drier than plastic limit
APL- About plastic limit
WTPL- Wetter than plastic limit
MWTPL- Much wetter than plastic limit

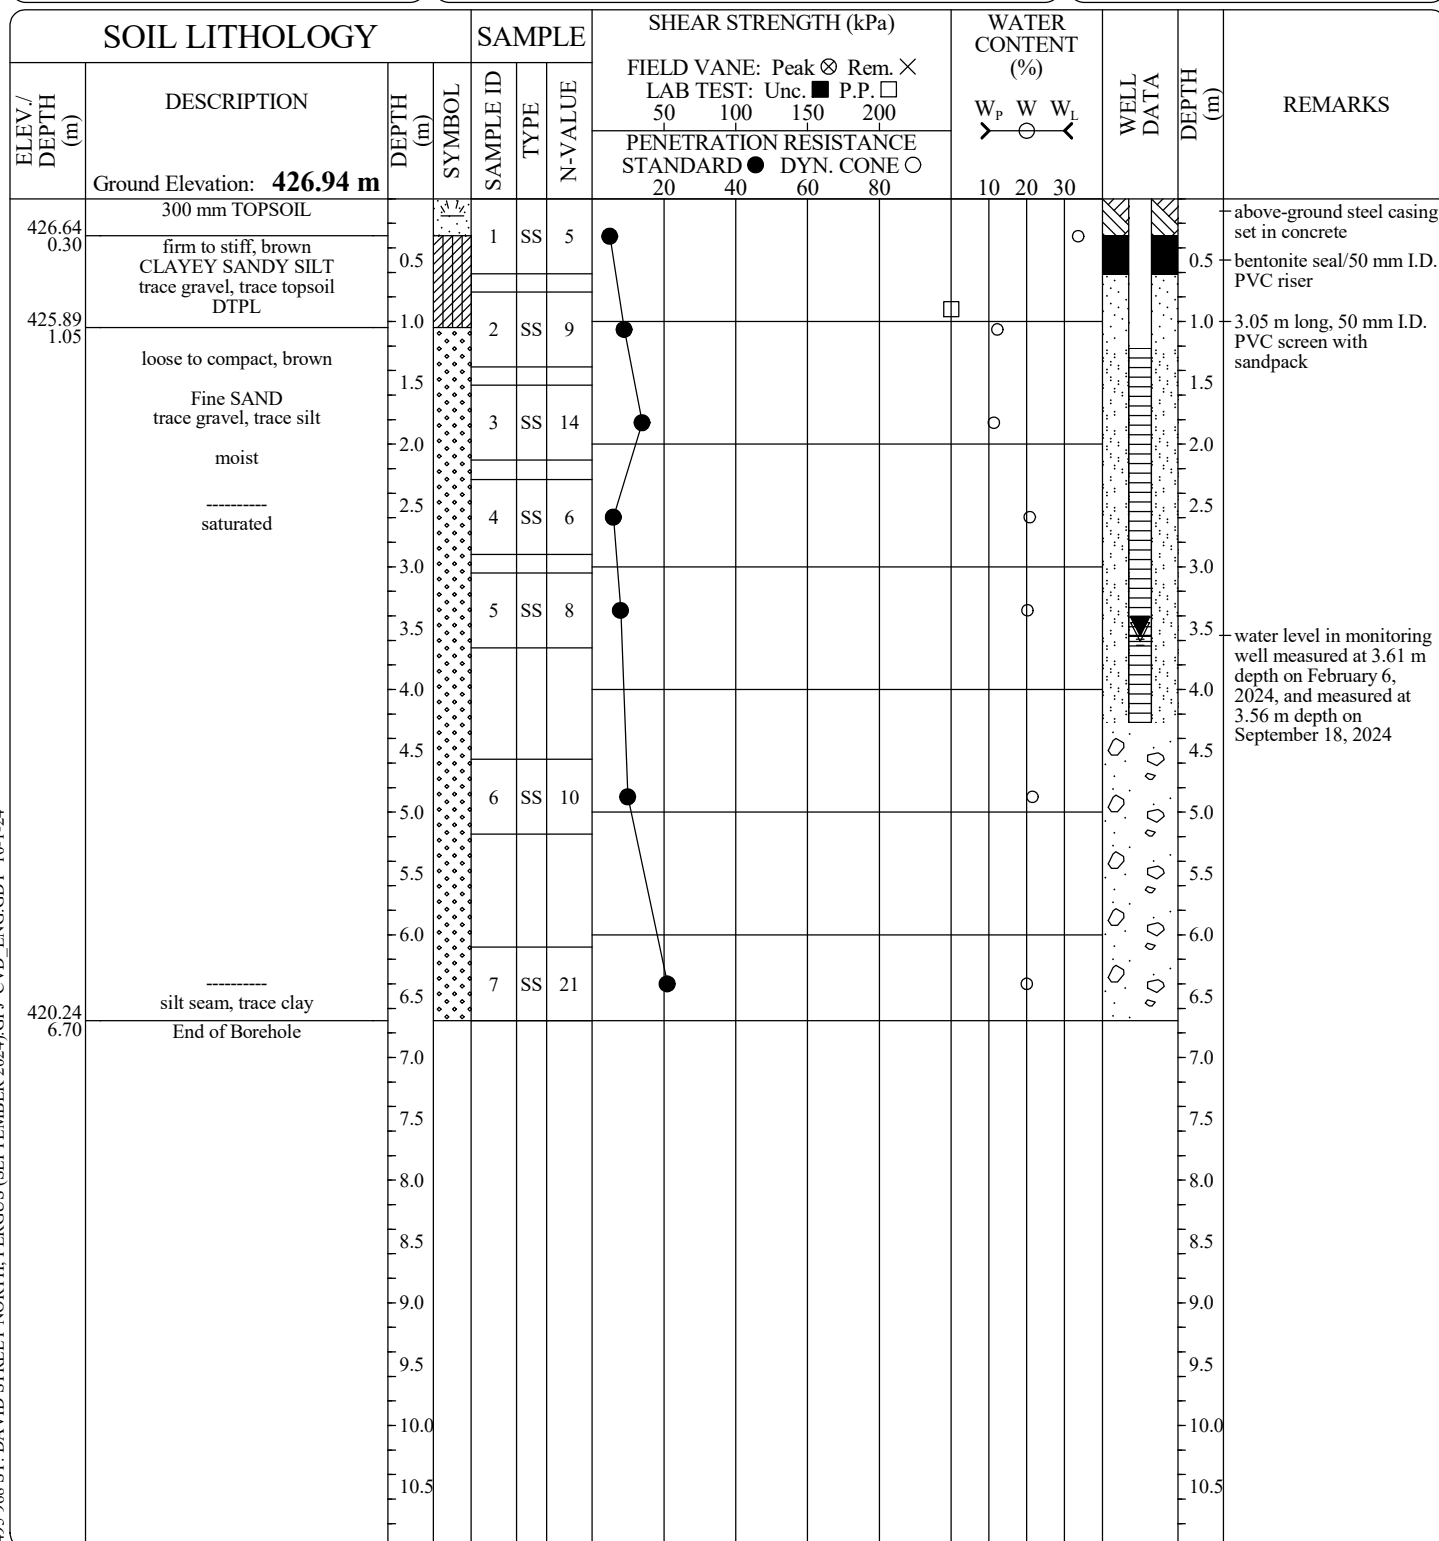

Cohesionless Soil
Damp
Moist
Wet
Saturated

SAMPLE TYPES AND ADDITIONAL FIELD TESTS

SS	Split Spoon Sample (obtained from SPT)	GS	Grab Sample	PP	Pocket Penetrometer
AS	Auger Sample	BS	Bulk Sample	VANE	Peak & Remolded shear
		TW	Thin Wall Sample or Shelby Tube	DMT	Flat Plate Dilatometer

LABORATORY TESTS

SG	Specific Gravity	S	Sieve Analysis	W	Water Content
H	Hydrometer	P	Field Permeability	K	Lab Permeability
W_p	Plastic Limit	W_l	Liquid Limit	I_p	Plasticity Index
GSA	Grain Size Analysis	C	Consolidation	UNC	Unconfined compression

Dear Mr. Puopolo:

RE: Preliminary Hydrogeological Investigation
Polocorp Fergus Subdivision – Phase 1
968 St. David Street North, Fergus, Ontario

This report summarizes the preliminary results of a hydrogeological investigation completed in support of a proposed subdivision containing a combination of residential single units, stacked townhouses, mixed-use units, roadways, a stormwater management facility, parkland, and other environmental features located at 968 St. David Street North in Fergus, Ontario.

If you have any questions or concerns regarding the report, please contact the undersigned.

Yours truly,
CHUNG & VANDER DOELEN ENGINEERING LTD.

Peter Dao, M.Sc., P.Geo.
Manager, Environmental & Hydrogeology

1.0 INTRODUCTION

Chung & Vander Doelen Engineering Ltd. (CVD) has been retained by the 'Client', Polocorp Inc., to complete a hydrogeological investigation for the property located at 968 St. David Street North in Fergus, Ontario ("Site"), as part of the Phase 1 development of the Polocorp Fergus Subdivision. The currently planned development comprises of Lot 18, Concession 16 of the Subject Lands.

The purpose of the investigation is to evaluate existing hydrogeological conditions at the Site in support of a proposal for a residential subdivision and subsequent development, comprised of a combination of residential single units, stacked townhouses, mixed-use units, roadways, a stormwater management facility, and park.

This report presents the preliminary findings of the ongoing hydrogeological investigation, conducted between February and September 2024 for the proposed subdivision. At the time of the writing of this report, only a Draft Plan of Subdivision (Polocorp Inc., December 10, 2024), as provided in Appendix A, was available for our review.

The 19.39±-hectare (ha) Site is currently comprised of a cultivated agricultural field, a residential dwelling fronting St. David Street North and its related structures, and a small wetland in the southeast corner of the Site. The Site is bound by St. David Street North to the west and predominantly by agricultural lands to the north, east, and south. An existing residential subdivision is situated directly southeast of the southeastern corner of the Site. Figure 1 shows the location of the subject Site in the Town of Fergus.

It is understood that the Site is to be fully municipally serviced with the water and wastewater services and will include the construction of a 2.41± ha sized stormwater management (SWM) facility within the southwest corner of the Site, and a roadway network throughout the subdivision, connecting it to St. David Street North, within the west portion of the site. This investigation characterizes the hydrogeological setting and assesses potential impacts from future servicing. Other characteristics of the future development are to include a 0.81± ha sized park (Block 25) and a 3.34± ha sized environmental feature and buffer. The existing wetland will be maintained as part of this environmental feature post-development.

The overall objectives of the hydrogeological investigation are as follows:

1. To characterize the hydrogeologic setting, using data from the current and previous investigations, with primary emphasis on the near surface hydrogeologic setting.
2. To assess the roles (or functions) that groundwater and surface water have with respect to the wetland and other environmental features at or adjacent to the property.
3. To identify and evaluate potential impacts and opportunities to enhance groundwater and surface water contribution to receptors from the proposed development, and to make recommendations to safeguard these features from the potential impacts associated with the development.

As this is a preliminary report, early in the investigation process, the objectives above cannot be fully addressed at this time. An updated report will be provided after the completion of the investigative scope of work.

2.0 INVESTIGATION SCOPE

2.1 BACKGROUND DATA REVIEW

The following background information (Section 8.0 lists the specific information), which has been considered and reviewed as part of this investigation:

2.2 BOREHOLE DRILLING & MONITORING WELL INSTALLATION

As part of both the initial hydrogeological and preliminary geotechnical investigations completed between January 15 and 17, 2024, five (5) boreholes were advanced to depths of between 5.20 and 8.25 m below existing grade, and monitoring wells were installed at each borehole location (labelled BH 4 to 8). A supplemental investigation was completed, between September 9 and 12, 2024, in which eight (8) additional boreholes/monitoring wells (labelled BH 106 to 113) were drilled and installed to a depth of 6.55 m below grade. These boreholes/wells were drilled/installed to investigate the shallow subsoil and shallow groundwater table conditions at the property.

The investigation was completed using a track-mounted CME-55 drill rig, equipped with standard 83 mm inner diameter hollow stem augers (HSA) operated by Davis Drilling Ltd. of Milton, Ontario. Soil samples collected during the borehole investigation program were examined in the field and subsequently

brought to CVD's laboratory for tactile and textural examination. Moisture content determinations were performed on all retrieved soil samples from the drilling program.

The ground surface elevation of the boreholes, monitoring wells, and geomorphological features of the site were surveyed by CVD for the purpose of this report using a Network RTK Global Navigation Satellite System (GNSS) Receiver. The survey data was collected using the UTM Zone 17N Projection, NAD83(CSRS)v7-2010 datum and Canada Geoid Model HT2_2010v70 (CGVD28).

2.3 DRIVE-POINT PIEZOMETER INSTALLATION

Shallow drive-point piezometers (DP) were installed at three (3) wetland/water course locations (DP1 to DP 3D, Figure 4) on November 10, 2023, and an additional (1) shallow piezometer (DP 3S) was installed on March 11, 2024, beside DP 3D. Furthermore, four (4) additional piezometers (DP 4S/4D and DP 5S/5D) were installed in other areas of the wetland as part of the September 2024 supplemental investigation. The piezometers were installed to investigate both groundwater and surface water levels (i.e., both inside and outside the piezometers) to characterize the groundwater-dependent features for the Grand River Conservation Authority (GRCA) regulated wetland, located within the southeast section of the Site. DP 1 was installed in the southern corner of the wetland at the edge of a pond connected to a stream travelling in a southern direction. DP 2 was installed roughly in the western central edge of the wetland, amongst cattails and other marsh-related vegetation, in what is likely an intermittent stream. DP 3S/3D were installed near the northwest edge of the wetland, in an area with no standing water. DP 4S/4D and DP 5S/5D were installed in the central area of the wetland – DP 4S/4D was installed in standing water (September) while the area surrounding DP 5S/D contained marsh-like vegetation but no standing water. According to the Grand River Conservation Authority (GRCA), the wetland in which DP 1, 2, 4S/D, and 5S/D are located is what is considered as a marsh, while the wetland beside DP 3S/3D is classified as a swamp. Figure 4 shows the locations of the drive-point piezometers within the wetlands and water courses.

The procedure for installing each drive-point piezometer was as follows: 1) auger a 0.85 m hole through the upper soil layers to observe the stratigraphy and groundwater conditions of the location 2) attach a 0.30-m long, 1.9-cm diameter stainless steel piezometer tip (or screen) to a length of 1.9-cm threaded steel riser pipe, 3) drive the assembled piezometer from ground surface to the depth desired using a post hammer, and 4) fill any annular space around the pipe with bentonite to prevent surface water from moving directly along the annulus to the piezometer screen.

2.3 WELL DEVELOPMENT, WATER LEVEL MONITORING, & RESPONSE TESTS

Each monitoring well was developed using Waterra™ polyethylene tubing and foot-valve hand pumps. As of the writing of this report, groundwater level monitoring was performed on five (5) occasions: on February 6, March 11, July 22, September 12, and September 18, 2024. Groundwater levels were obtained at all of the monitoring wells and piezometer locations during each occasion. Table 1 provides a summary of the groundwater levels and calculated elevations for the five monitoring events. Four (4) water level measurements were recorded from the drive point mini piezometers; DP 1 to DP 3D starting

in November 2023; however, the results have not yet been completed and will be included in future revisions of the report once more data is collected.

Well response tests (slug/bail tests) were completed at three (3) of the monitoring well locations (Boreholes 5 to 7) on March 11, 2024, to provide a more accurate estimate of the hydraulic conductivity (K) (or permeability) of the saturated aquifer subsoil strata, to assist in providing more accurate infiltration rates. The hydraulic conductivities were calculated through the Aquifer Test software utilizing the Bouwer and Rice method. The results of the tests are graphically presented in Appendix C, and a summary of the data is also included in Table 1.

Furthermore, five (5) grain size distribution analyses were carried out on representative subsoil samples to help identify and assist in providing estimates of hydraulic conductivities for the encountered groundwater-bearing subsoil deposits. The results of these tests are presented in Enclosures 22 and 28.

Additionally, to provide a more comprehensive summary of groundwater conditions at the Site, six (6) Van Essen DI801 10 m TD-Diver automated data loggers and one (1) Baro-Diver were installed in wells BH 5, 7, 101, 106, 111, and 113. Furthermore, two (2) DI601 10 m Micro-Divers were installed in DP 1 and DP 3D. The automated monitoring at these wells/piezometers using the dataloggers is currently ongoing.

3.0 SITE CHARACTERIZATION

3.1 TOPOGRAPHY, DRAINAGE & WETLAND FEATURES

The Site is within the Upper Grand River watershed and is fully encompassed within the West Montrose – Grand River subwatershed. Locally, the groundwater table and any surface water runoff traverses across the site in a generally north to south orientation, towards the southwestern corner of the property and towards the wetland, located within the southeastern corner/side of the Site.

According to the Grand River Conservation Authority (GRCA), the wetland within the southeastern corner of the Site is GRCA regulated and is split into two categories: marsh and swamp. Roughly the northern third of the wetland and a small section of the southeastern side of the area are designated as a swamp wetland, while the remainder of the wetland is designated as a marsh. The wetland extends past the southern confines of the Site and includes multiple ponds connected by perennial streams. Occasional intermittent streams can be observed travelling along the north-south axis across the wetland, towards the southern streams/ponds. Various trees, frequent cattails, and other marsh-related vegetation are present throughout most of the wetland. The GRCA mapping for the regulated lands abreast of the wetlands and water courses are shown on Figure 3.

Regionally, the surface topography decreases significantly towards Guelph and Kitchener/Waterloo, and generally increases north, towards The Grand Valley and Arthur. Elevations also decrease westward, towards Listowel, and significantly decrease eastward, towards Brampton. Currently, the topography in the area is formed from the most recent glacial activity (Wisconsin). The area around Fergus is full of

kames associated with the Orangeville Moraine (Karrow, 1968). Figure 1 shows the topographic contours across the site.

Local Site topography is considered 'rolling land', with ground elevations from north to south across the site ranging from 427± to 420± mASL. There is also generally a slight increase in surface elevation from east to west, across the Site. The current terrain on-Site is relatively even, with no major undulations, or topographical features. In general, runoff will mimic topography flowing to low elevations where water courses and wetlands are present. As a result, surface runoff from the farm fields is anticipated to be primarily controlled by topography and to drain towards the relatively lower lying south/wetland portion the property.

Excluding the wetland, most of the Site consists of a farm field with occasional minor residential/grassy areas fronting St. David Street North.

3.2 GEOLOGIC SETTING

Surface geological mapping for the area (by Karrow P.F., 1968) is presented in the Quaternary Geology map of Figure 2. According to Karrow (1968), the Site is primarily underlain by lacustrine, kame deposits, comprising mainly outwash sands, with an underlying Wentworth till unit. Both deposits were laid down during the late Wisconsinan stage of the Pleistocene period. The local topography of the area has been largely influenced by the presence of The Wentworth Till. The entire area is underlain by dolostone bedrock of the Guelph Formation. This is confirmed through the MECP well record data for drinking water wells in the area surrounding the property, as included in Appendix G. According to the records, bedrock was encountered at depths between 24± and 32± m below existing grade (mbeg). Bedrock outcrops can be found in certain areas around Fergus and are notably present towards the southwest within the Elora Gorge.

The monitoring well-recorded data and borehole log data (Enclosures 4 to 8 and 14 to 21) collected during the Site investigation are generally consistent with Quaternary geological mapping. Based on the drilled boreholes, the surficial and subsoils encountered generally consisted of topsoil underlain by a 0.5 to 1.5 m thick layer of sandy silt to silty sand, in turn underlain by a major layer of fine sand with trace to some silt. North of the Site, fine sand deposits can extend deeper than 9.60 mbeg but only extend to 1.85 mbeg beneath the south portion (BH 7). Boreholes 109 to 113 contained only minor sand seams. The subsoil here is predominantly composed of sandy silt to silty sand and/or silt, underlain by a clayey silt till/sandy silt till deposit. Similarly, a clayey silt till with some sand content, ranging from trace sand to sandy was encountered in Boreholes 6 to 8, underlying the sand deposit. Based on the findings from the subsurface investigation, it appears that the contact depth of the clayey silt till/sandy silt till layer increases in elevation towards the south part of the property. This geological unit is probably the Wentworth Till deposit, referred to in Karrow (1968); however, it should be noted that the deposit was not encountered during this investigation anywhere in the north portion of the Site as was depicted in the geological maps. Occasional silt layers were also encountered interlayered with the clayey silt till.

3.3 HYDROGEOLOGIC SETTING

3.3.1 Water Table Depth and Configuration

The water table exists predominantly within the shallow fine to granular deposits (fine sand, sandy silt to silty sand, and silt subsoils) encountered beneath the entire Site. The encountered depth of the groundwater table greatly reduces from north to south across the property. Table 1 summarizes the groundwater level measurements collected thus far during this investigation from the period extending from February 2024 to September 2024 at all of monitoring well locations.

Figure 5 presents an interpretation of the water table configuration and shallow groundwater flow directions across the property using the groundwater elevation measurements gathered on September 18, 2024. As expected, the water table mimics the topography with shallow groundwater flowing southerly towards the southeastern portion of the Site in the direction of the wetland. Additionally, groundwater appears to also flow into the existing drainage feature located within the southwestern corner of the Site.

During the monitoring period, according to the gathered data, groundwater levels were encountered at depths ranging between 2.02 (BH 5) and 0.52 mbeg (BH 8), corresponding to elevations ranging between 423.59 and 420.50 masl according to the July 22, 2024, water levels measurements. It should be noted that these high-water levels documented during the summer season are likely caused by the abnormally high amount of precipitation experienced throughout the first half of 2024. Furthermore, groundwater level monitoring is required to understand the seasonal and yearly variability in groundwater elevations across the Site. Ongoing groundwater monitoring is being conducted on a seasonal basis to provide an evaluation of the seasonal variability of the groundwater table and its fluctuations. Appendix D includes a summary table of measured groundwater levels (Table 1) and interpreted hydrographs collected during the monitoring period. The hydrographs were plotted against monthly precipitation data sourced from the Government of Canada Environment and Natural Resources Daily Data Reports for the Fergus Shand Dam weather station, the nearest active weather station to the Site.

3.3.2 Groundwater Infiltration and Recharge

Groundwater infiltration rates are expected to vary across the Site; however, due to the general predominance of shallow fine grained sand deposits throughout the entire Site, infiltration rates are expected to be generally fast. Infiltration and recharge areas are also heavily influenced by the topographical features of the land, which in this case promotes shallow groundwater to flow towards the south.

Based on the single well response tests and physical examination of the soil deposits, the correlating estimated infiltration rates for the various surficial soils at the property range as follows:

- Fine to Medium Sand: 75 to 150 mm/hr
- Silty Sand: 15 to 30 mm/hr

- Sandy Silt to Sand and Silt: 10 to 20 mm/hr
- Silt: 3 to 5 mm/hr
- Clayey Silt Till: <1 mm/hr

According to data layers provided from the GRCA-Web GIS application, the property has a recharge rate of $320\pm$ to $370\pm$ mm/year. Recharge/infiltration should be high due to the ubiquitous presence of the fine sand deposit and its overall 'dry' condition, especially within the northern section of the Site where the water table during the peak groundwater elevation period (February to March 2024) was encountered at depths of between $2\pm$ to $3\pm$ mbeg.

During the period of higher groundwater elevations, expected during the spring and fall, infiltration is expected to be reduced in the wetland; however, considering the intermittent nature of the streams and surface water features in the marsh section of the wetland, infiltration will likely increase during the summer and fall seasons as the water table lowers. A large portion of the wetland is interpreted to promote groundwater recharge, as will be further discussed in the next section.

3.3.3 Groundwater / Surface Water / Wetland Interaction

The interactions occurring in the wetland area were examined based on both field observations and surface water/groundwater level data gathered at the five (5) mini-piezometer locations: DP1, DP2, DP3S/3D, DP 4S/4D, and DP 5S/5D (Figure 4). It is interpreted that a large portion of the wetland located on the estate is largely intermittent in nature, with more perennial surface water features located south of the property.

DP 1, which is located within a pond on the southwestern edge of the wetland, has continually exhibited a noticeable positive vertical hydraulic gradient (VHG) since installation, evidence that this is primarily a groundwater discharge area. Based on the current collected data and field observations, the surface water features in this area are some of the only perennial groundwater features found on the property and they are connected to the larger streams and ponds found south of the Site. Aside from groundwater discharge to maintain the wetland, surface water runoff also aids in maintaining these features since they are located in the relatively lowest section of the property in an area where there are fewer sand deposits, and higher amounts of clayey silt/sandy silt till deposits, and an overall higher groundwater table, all of which reduces potential infiltration of surface water and helps drive runoff towards the wetland.

The data collected at DP 2 shows a variable nature, switching from a clearly negative VHG from November to December 2023, indicating groundwater recharge, to a neutral VHG from February to July 2024. This is likely symptomatic of the conjectured intermittent nature of the marsh surface water features.

The preliminary groundwater data collected during September 2024 from both DP 4S/4D and DP 5S/5D show a clearly negative (recharging) VHG; however, it is predicted that the groundwater within these piezometers will also show intermittent behavior. More data is required to provide firm conclusions.

So far, not enough data has been collected at DP 3S/3D to provide an adequate evaluation of the conditions existing in that section of the eastern wetland. An initial comparison of the groundwater elevations (September 2024) with the mini piezometers to the groundwater elevations collected in the nearby well BH 107, potentially suggests a neutral VGH at the time of measurement. More data is required to provide firm conclusions.

3.4 SOURCE WATER PROTECTION AND GROUNDWATER USE

The entire Site is located within the Fergus Wellhead Protection Area (WHPA). Fergus currently has six (6) municipal supply wells (wells F1, F2, F4, F5, F6, F7), with the Site located in between three of these wells (F4, F6, F7). According to data provided on the GRCA-Web GIS application, most of the property is classified as WHPA-C, denoting an area in which travel time is between 2 to 5 years, and with a vulnerability score of 6. The entire eastern boundary of the Site falls within WHPA-B for the municipal well, F6, denoting an area in which the groundwater travel time to the well is 2 years or less, and having a vulnerability score of 8. Both sections are considered to have a medium vulnerability. It should also be noted that the Belwood Reservoir, where the lake levels are controlled by the Fergus Shand Dam, is located along the Grand River, upstream of Fergus.

All six (6) of the existing municipal supply wells pump groundwater from the dolostone bedrock aquifers of the Guelph, Gasport, and Goat Island Formations. They are both primarily cased and open in the Guelph Formation dolostone. One of these six wells (F2), which is now inactive, is a well with groundwater under the direct influence of surface water (GUDI). Transmissivity values of the Fergus wells range between 52 to 395 m²/day (Matrix Solutions Inc., 2017). The wells were drilled to depths of between 76.5 mbeg (F2) and 138.7 mbeg (F7).

Regarding the water quality at the Site, three (3) groundwater samples were submitted from monitoring wells at BH 5, 6, and 7 for analysis of general chemistry, nutrients, and metals. These samples were submitted to the AGAT Laboratories of Mississauga for testing/analysis, with results being provided in Appendix F. No major concerns were identified. Elevated levels of iron were present which exceed the aesthetic drinking water objectives; however, this is naturally occurring within the shallow groundwater of the area. Minor amounts of cadmium, cobalt, copper, vanadium, and zinc were also detected. Slightly elevated amounts of sulphate were also detected in the monitoring wells BH 5 and 7, and slightly higher amounts of nitrate were detected in BH 6, likely caused by on-going agricultural activity. Nitrate and nitrite levels measured at BH 7, in the proposed area for the SWM facility, met Ontario Drinking Water Standard criteria. No chemical threats to groundwater at the Site were detected.

4.0 WATER BUDGET ASSESSMENT

Pre-Development Water Balance

Precipitation ultimately becomes split into three 'water budget' components: evapotranspiration, runoff, and recharge, with the latter two often referred to together as 'the water balance' (i.e., the remainder after evapotranspiration is removed). Groundwater recharge rates will vary at a given site

based on the permeability of the surficial deposits but will also depend on topography and type of vegetative cover. Most of the subject property has been historically agricultural and has had different types of crops depending on the year, with no crop planted at all during certain portions of the year. During fall to summer 2024, winter wheat was being grown.

A pre-development water balance for the property has been estimated using the Water Balance Method (WBM) of Thornthwaite and Mather (1957), a method cited in the MECP document “Stormwater Management Planning and Design Manual” (March 2003) to estimate evapotranspiration. The calculations utilize the 1981-2010 ‘Climate Normals’ from the closest weather station located at the Fergus Shand Dam (gives an annual precipitation rate of 946 mm/yr) and considers a combination of cultivated land use with moderately deep-rooted crops (e.g. wheat), pasture & lawns, wetland, and impervious surfaces. Using these conditions, the subject site has an average evapotranspiration rate of about 56.5% (or 536 mm/yr) and remaining ‘water balance’ of about 43.5% (410 mm/yr) is estimated. The 2003 MECP document also provides a methodology for estimating the proportions of the water balance that ultimately become runoff vs. recharge, based on applicable infiltration factors for soil, vegetative cover, and topography.

The overall water balance and water budget calculations are included in Appendix E. In summary, the pre-development average annual water budget for the 19.39± ha property is as follows:

A) Pervious Cultivated Land of 14.35 ha

Precipitation	946 mm/yr	135,737 m ³ /yr
Evapotranspiration	536 mm/yr	76,876 m ³ /yr
Water Balance	410 mm/yr	58,861 m ³ /yr
Recharge	287 mm/yr	41,202 m³/yr
Runoff	123 mm/yr	17,658 m ³ /yr

B) Pervious Pasture & Lawns of 1.50 ha

Precipitation	946 mm/yr	14,189 m ³ /yr
Evapotranspiration	536 mm/yr	8,036 m ³ /yr
Water Balance	410 mm/yr	6,153 m ³ /yr
Recharge	308 mm/yr	4,615 m³/yr
Runoff	103 mm/yr	1,538 m ³ /yr

C) Pervious Woodland & Wetland of 3.34 ha

Precipitation	946 mm/yr	31,593 m ³ /yr
Evapotranspiration	536 mm/yr	17,893 m ³ /yr
Water Balance	410 mm/yr	13,700 m ³ /yr
Recharge	328 mm/yr	10,960 m³/yr
Runoff	82 mm/yr	2,740 m ³ /yr

D) Impervious Rooftops to Pervious Areas of 0.20 ha

Precipitation	946 mm/yr	1,892 m ³ /yr
Evapotranspiration	95 mm/yr	189 m ³ /yr
Water Balance	851 mm/yr	1,703 m ³ /yr
Recharge	213 mm/yr	426 m³/yr
Runoff	638 mm/yr	1,277 m ³ /yr

Assuming that the wetland area is to remain undeveloped, the target recharge quantity for matching in post-development is 46,243 m³/yr. Recharge can likely be met through a stormwater management design utilizing enhanced infiltration facilities as Low Impact Development (LID) infrastructure for the developed site.

5.0 SITE SERVICING REQUIREMENTS & IMPACT ASSESSMENT

5.1 WASTEWATER SYSTEMS & POTENTIAL IMPACT OF EFFLUENT

The proposed subdivision will be connected to municipal sanitary sewers. No private wastewater treatment system requirements are anticipated for the proposed subdivision.

5.2 WATER SUPPLY & POTENTIAL IMPACT OF WATER TAKING

The proposed subdivision will be serviced by municipal water services. No private water supply service requirements are anticipated.

5.3 STORMWATER MANAGEMENT & POTENTIAL IMPACT TO GROUNDWATER RECHARGE

The proposed subdivision will be serviced by municipal stormwater management works; however, at the time of the writing of this report, aside from an overall concept, no specific design drawings/plans were available. As the realization of the project proceeds, addendums addressing stormwater management and any theoretical impacts to groundwater recharge including proposed LID infrastructure at the Site may be provided during the detailed design stage.

It is understood that a 2.41± ha SWM facility is to be constructed in the southwestern area of the Site. The general shallow groundwater gradient travels towards the proposed location of the SWM facility. The fine sand deposits generally thin out while simultaneously, the clayey silt till deposits rise in elevation towards the south of the property. Groundwater levels in the area ranged from the depths of 0.2± to 0.5± mbeg (elevations 420.6± to 421.4± mASL) during the winter to spring 2023-2024, corresponding to the high-water table. Since it is recommended that the base of any infiltration facilities be situated no less than 1 m above the seasonally high-water table to ensure reliable infiltration functionality, the SWM facility will likely have to be raised or redesigned in a way to avoid the

near-surface shallow groundwater table.

Further groundwater monitoring is being performed to better understand the water table and its seasonal variations to support development design.

Due to the abundance of ‘dry’ and highly permeable sands throughout much of the Site, infiltration galleries, open ditches and/or swales, and or soak away pits can be constructed into the sandy soils to maintain pre-development recharge rates. Further recommendations may be provided once a more detailed plan is available.

It is important to ensure that the adjacent regulated wetland east of the proposed SWM facility is not negatively impacted following development. The current conceptual plan (July 2024) proposes a 10 m buffer zone between the wetland and the remainder of the Site. During the design of the stormwater facilities, it is critical that water balance and quality of water are maintained throughout the property, and any potential effects associated with erosion and sedimentation control to the topographical /environmental features are properly designed and controlled.

The Stormwater Management Planning and Design Manual (March 2003) provided by the Ministry of Environment may be used as a reference to the planning of the stormwater systems. Additionally, the Township of Centre Wellington Sewer Use By-Law No. 2022-66 should be consulted.

6.0 CONCLUSIONS & RECOMMENDATIONS

Based on the results of the hydrogeological investigation described in this report, the following conclusions and recommendations are provided.

1. The subject property is predominantly underlain by fine sand deposits of the late Wisconsin stage of the Pleistocene period, which reduces in thickness from north to south across the property. A clayey silt till/sandy silt till deposit, likely the Wentworth Till, underlies the fine granular deposits and generally increases in contact elevation to the south. During the spring to early summer 2024 period, the groundwater table depth depths ranged between 0.25 (BH 8) and 2.10 mbeg (BH 5) across the property, corresponding to elevations between 423.62 (BH 5) and 420.76 (BH 8) masl.
2. Topography decreases in elevation from north to south with ground surface elevations approximately ranging from between 427± to 420± mASL. Shallow groundwater generally mimics the topography of the Site and flows towards the southwestern corner of the property and towards the southeastern wetland.
3. Due to the predominance of the underlying fine sand deposits with a high infiltration rate (100 mm/hr), and the relatively deeper lying groundwater table beneath the north section of the site (2± to 3± mbeg, March 2024), infiltration/recharge opportunities throughout the Site should be abundant. Based on the calculated pre-development water balance, the Site has an average evapotranspiration rate of about 56.5% (or 536 mm/yr) and a remaining ‘water balance’ of about

43.5% (410 mm/yr) is estimated. Assuming that the wetland area is to remain undeveloped, the target recharge quantity for matching in post-development is 46,243 m³/yr.

4. The wetland area is split into two categories: swamp and marsh. Currently, the available data suggests that much of the wetland area is considered to have intermittent surface water features which are primary involved in groundwater recharge and infiltration. However, perennial swamps and streams do exist within the southern portion of the wetland at the southwestern edge of the Site, where an upward vertical hydraulic gradient and an overall groundwater discharge condition has been observed.
5. The property falls within the Fergus Wellhead Protection Area (WHPA) and is currently classified as WHPA-C and WHPA-B with an overall medium vulnerability rating between 6 and 8. The property is located between three (3) of the six (6) Fergus municipal supply wells. No chemical threats or concerns were identified within the property bounds.
6. Site servicing (wastewater, water supply, stormwater management) for the development is to be fully municipally supplied. At the time of the writing of this report, aside from a general concept plan showing the location of the proposed SWM facility, no specific design drawings / plans were available. It is also recommended that as design plans are updated and information becomes available, addendums be added to address the specific site servicing issues. Furthermore, groundwater monitoring should be completed to aid in the design and location of the proposed SWM facility and any proposed LID, infiltration infrastructure.
7. Seasonal groundwater monitoring is incomplete and is ongoing at the Site to better characterize the hydrogeological setting and groundwater/surface water interactions.
8. It is recommended that once finished floor elevations and a site grading plan are available, that CVD be retained to review the final design and provide updates to the recommendations and conclusions provided in this report. Based on the final design, additional boreholes/monitoring wells might be required to delineate the extent of the water table and provide additional information.

7.0 CLOSING

This hydrogeological investigation report has been prepared for the exclusive use of the Client and their assigns for specific application to this project property.

The assessment was conducted in accordance with the verbal and written requests from the Client, and generally accepted assessment practices. Performance of this assessment is intended to reduce, but not eliminate, uncertainty regarding the hydrogeological conditions encountered at the project site, given reasonable limits of time and cost. No other warranty, expressed or implied, is made.

We trust this report is sufficient for your immediate requirements. If you have any questions, please do not hesitate to contact the undersigned.

Respectfully submitted,
CHUNG & VANDER DOELEN ENGINEERING LTD.

- Notes:
- 1) All Elevations Referenced to Geodetic Survey by CVD.
 - 2) Bolded elevations represent the maximum water table aquifer elevation measured at each monitoring well throughout all seasons.
 - 3) Negative water level indicates that water level is above ground.
 - 4) : Monitoring well/piezometer dry
 - 5) Negative fluctuation indicates drop in water level relative to baseline.

Determination of Water Balance as 'Combined-Runoff' (Recharge + Direct Runoff) - (using WBM Assumptions)															
Soil Moisture Surplus (SMS)	mm	158.2		0.0	0.0	0.0	44.9	14.4	0.0	0.0	0.0	0.0	13.3	85.6	0.0
Water Balance from SMS (Assumption 1)	mm	144.8		10.8	5.4	2.7	23.8	19.1	9.6	4.8	2.4	1.2	0.6	43.1	21.5
				0.03	0.01	0.00	0.00	7.20	3.60	1.80	0.90	0.45	0.22	0.11	0.06
				0.04	0.02	0.01	22.47	11.23	5.62	2.81	1.40	0.70	0.35	0.18	0.09
				10.69	5.35	2.67	1.34	0.67	0.33	0.17	0.08	0.04	0.02	42.78	21.39
Accumulated Snow (Assumption 2)	mm	252.0		0.0	0.0	0.0	252.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Water Balance from Snow (Assumption 3)	mm	252.0		0.5	0.3	0.1	25.2	113.4	56.7	28.4	14.2	7.1	3.5	1.8	0.9
Water Balance as 'Combined-Runoff'	mm	396.8	42.0	11.3	5.7	2.8	49.0	132.5	66.3	33.1	16.6	8.3	4.1	44.8	22.4

Assumptions for Monthly 'Combined-Runoff' Estimations (from WBM):

- 1 - Combined 'Runoff' from the Soil Moisture Surplus is assumed to be 50% in the first month and then 50% of the remaining soil surplus each following month.
- 2 - All Snow is Accumulated and Stored throughout Winter Sub-Zero Months (i.e. No melt until first above-zero month)
- 3 - Combined 'Runoff' from Snowmelt is assumed to be 10% of the Accumulated Snow in the first month and then 50% of the remaining snowmelt in each following month.

Determination of Recharge + Direct Runoff Components - using MOE Infiltration Factor Method (MOE 1995, 2003)															
Catchment Area (m ²)	MOE Infiltration Factors (0 to 1.00)					Annual Rates				Annual Rates					
	Topography		Soil		Cover	Sum	EvapoT (mm)	Balance (mm)	Recharge (mm)	Runoff (mm)	EvapoT (m ³ /yr)	Balance (m ³ /yr)	Recharge (m ³ /yr)	Runoff (m ³ /yr)	
Pervious, Cultivated Land 143,500 m2	Rolling	0.2	Sand	0.4	Cultivated	0.1	0.7	535.7	410.2	287.1	123.1	76,876	58,861	41,202	17,658
								56.6%	43.4%	30.4%	13.0%	56.6%	43.4%	30.4%	13.0%

WATER ANALYSIS REVIEWED BY: Yris Verastegui, Inorganic Team Lead

DATE REPORTED: Mar 22, 2024

PAGES (INCLUDING COVER): 10

VERSION*: 1

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

***Notes**

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

Water Quality Assessment - PWQO (mg/L)

DATE RECEIVED: 2024-03-13

DATE REPORTED: 2024-03-22

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to PWQO * Variable - refer to guideline reference document
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

5722603-5722666 Dilution required, RDL has been increased accordingly.
Un-ionized Ammonia detection limit is a calculated RDL. The calculation of Un-ionized Ammonia is based on lab measured parameters (ammonia as N, pH and temperature). Values are reported as calculated.

Analysis performed at AGAT Toronto (unless marked by *)

APPENDIX H

Limitations of Report

STATEMENT OF LIMITATIONS

1. The work performed in this report was carried out in accordance with the Standard Terms of Conditions made part of our contract. The conclusions presented herein are based solely upon the scope of services and time and budgetary limitations described in our contract.
2. The report has been prepared in accordance with generally accepted hydrogeological study and/or engineering practices. No other warranties, either expressed or implied, are made as to the professional services provided under the terms of our contract and included in this report.
3. The services performed and outlined in this report were based, in part, upon visual observations of the site and attendant structures. Our opinion cannot be extended to portions of the site which were unavailable for direct observation, reasonably beyond the control of CHUNG & VANDER DOELEN ENGINEERING LTD.
4. The objective of this report was to assess hydrogeological conditions at the site, within the context of our contract and hydrogeological assessment guidelines within the applicable jurisdiction. Evaluating compliance of past or future owners with applicable local, provincial and federal government laws and regulations was not included in our contract for services.
5. CHUNG & VANDER DOELEN ENGINEERING LTD. has relied in good faith on information and services provided by others while conducting the record search. We accept no responsibility for any deficiency, misstatements or inaccuracies contained in this report as a result of omission, misinterpretation or fraudulent acts of the services used.
6. It should be noted that the observations and recommendations presented in this report are limited to the actual locations explored. The information presented in terms of the thickness and types of the subsoils encountered, groundwater levels, and chemical testing results, etc., are only applicable to the actual locations explored. Variations may be present between these locations. Should significant variation become apparent during later investigations, it may be necessary to reevaluate the findings of this report.
7. The conclusions of this report are based in part, on the information provided by others. The possibility remains that unexpected environmental conditions may be encountered at the site in locations not specifically investigated. Should such an event occur, CHUNG & VANDER DOELEN ENGINEERING LTD. must be notified in order that we may determine if modifications to our conclusions are necessary.

ENCLOSURES

Soil Abbreviations and Terms Used on Record of Borehole Sheets

TERMINOLOGY DESCRIBING COMMON SOIL TYPES:

Topsoil	-	mixture of soil and humus capable of supporting vegetation
Peat	-	mixture of visible and invisible fragments of decayed organic matter
Till	-	unstratified glacial deposit which may range from clay to boulders
Fill	-	soil materials identified as being placed anthropologically

CLASSIFICATION (UNIFIED SYSTEM)

Clay	<0.002mm
Silt	0.002 to .075mm
Sand	0.075 to 4.75mm
	Fine 0.075 to 0.425 mm
	Medium 0.425 to 2.0 mm
	Coarse 2.0 to 4.75 mm
Gravel	4.75 to 75mm
	Fine 4.75 to 19 mm
	Coarse 19 to 75 mm
Cobbles	75 to 300mm
Boulders	>300mm

TERMINOLOGY

Soil Composition	% by Weight
"traces"	<10%
"some"(eg. some silt)	10-20%
Adjective (eg. sandy)	20-35%
"and"(eg. sand and gravel)	35-50%

Standard Penetration Resistance (SPT): Standard Penetration Resistance ('N' Values) refers to the number of blows required to advance a standard (ASTM D1586) 51 mm Ø (2 inch) split-spoon sampler by the use of a free falling, 63.5 Kg (140lbs) hammer. The number of blows from the drop weight is recorded for every 15 cm (6 inches). The hammer is dropped from a distance of 0.76m (30 inches) providing 474.5 Joules per blow. When the sampler is driven a total of 45 cm (18 inches) into the soil, the standard penetration index ('N' Value) is the total number of blows for the last 30 cm (12 inches).

Dynamic Cone Penetration Resistance (DCPT): Dynamic Cone Penetration Resistance is similar to a SPT with the 474.5 Joule/blow impulse provided by the free falling hammer where the split-spoon sampler is replaced by a 51 mm Ø, 60° conical point and the number of blows is recorded continuously for every 30 cm (12 inches).

COHESIVE SOILS CONSISTENCY

	(kPa)	(P.S.F.)	Nominal 'N' Value
Very Soft	<12	<250	0-2
Soft	12-25	250-500	2-4
Firm	25-50	500-1000	4-8
Stiff	50-100	1000-2000	8-15
Very Stiff	100-200	2000-4000	15-30
Hard	>200	>4000	>30

RELATIVE DENSITY OF COHESIONLESS SOIL

	'N' Value
Very Loose	0-4
Loose	4-10
Compact	10-30
Dense	30-50
Very Dense	>50

MOISTURE CONDITIONS:

Cohesive Soil
DTPL- Drier than plastic limit
APL- About plastic limit
WTPL- Wetter than plastic limit
MWTPL- Much wetter than plastic limit

Cohesionless Soil
Damp
Moist
Wet
Saturated

C.2. Interim Post-Development Conditions Modelling

NORTH LANDS SUBDIVISION
TOWNSHIP OF CENTRE WELLINGTON (FERGUS)
Our File: 422079
March 4, 2025

Proposed Forebay

Forebay Length =	140.0 m	(Dist)
Forebay Top Width =	27.0 m	
Active Forebay Depth =	1.0 m	(d)
Active Forebay Bottom Width =	21.0 m	
Approximate Permanent Forebay Pool Volume =	224.9 m ³	
Length Width Ratio =	5.2 :1	(r)
25 mm Storm Pond Outlet Flowrate =	0.043 m ³ /s	(Q25mm)
5 Year Storm Inflow Rate =	8.626 m ³ /s	(Q5)
Desired Forebay Velocity =	0.500 m/s	(Vf)
Desired Settling Velocity (recommended) =	0.0003 m/s	(Vs)

Settling Length

$$\text{Dist} = ((r \times Q25\text{mm})/V_s)^{.5} = 27.3 \text{ m} \quad 25\text{mm}$$

Forebay length (140 m) exceeds the settling length (27.3 m).

Dispersion Length

$$\text{Dist} = (8 \times Q5)/(d \times V_f) = 138.0 \text{ m} \quad 5 \text{ Year}$$

Forebay length (140 m) exceeds the dispersion length (138.0 m).

Flow Velocity in Forebay

Cross-sectional Area (Forebay Only) =	24 m ²	
Cross-sectional Area (With Permanent Pool) =	41.85 m ²	
Cross-sectional Area (With Outlet Pool) =	57.85 m ²	(A)
Q5 =	8.626 m ³ /s	
Velocity = Q5/A =	0.149 m/s	5 Year

The average flow velocity through the forebay is equal to the allowable velocity of 0.15 m/s.

1800 x1800 Structure Controls

Orifice Outlet (Extended Detention)

modelled with 50% blockage

INV = 421.50 m
 Q = 0.044 m³/s
 Cd = 0.600
 H = 1.100 m
 2g = 19.620
 A = 0.031 m²
 D = 0.200 m

Overflow Weir

d1 = 1.500 m
 h = 1.200
 H = 0.300 m
 2g = 19.620
 L = 15.0 m
 Q = 3.524 m³/s

$$\text{Orifice Flow} = Cd A \sqrt{2gH}$$

Cd = Discharge Coefficient
 A = Area of Orifice
 2g = 19.62
 H = Depth of Water above orifice - half of orifice diameter

Major Control - Flow Over Grate

modelled with 50% blockage

d1 = 0.80 m
 h = 0.50
 H = 0.30 m
 2g = 19.62
 L = 3.66 m
 Q = 0.453 m³/s

Length of Weir

Head over Grate (m)	Length (m)
0	1.200
0.1	1.832
0.2	2.464
0.3	3.66

Pipe Outflow - Outlet 1

INV. = 421.34 m
 Diameter = 525 mm
 Gradient = 0.50%
 Pipe Capacity = 0.317 m³/s
 Length = 21.30 m

Pipe Outflow - Outlet 2

INV. = 421.5 m
 Diameter = 600 mm
 Gradient = 1%
 Pipe Capacity = 0.641 m³/s
 Length = 20.30 m

$$\text{Weir Flow} = 0.433 \sqrt{2g \left(\frac{d}{d+h} \right)} LH^{3/2}$$

L = Length of Weir
 2g = 19.62
 d = total depth of water
 h = depth of water below weir
 H = depth of water above weir

Notes:

Major Controls - the minimum of flow over grate and pipe discharge flow rate is used in the actual discharge calculation

Knockout Controls - the knockout is assumed to contribute to discharge flow rates until the pipe discharge rate is the controlling release rate.

Major Control Pipe Flow - based on Pipe Capacity

March 4, 2025

Proposed Forebay

Forebay Length =	140.0 m	(Dist)
Forebay Top Width =	27.0 m	
Active Forebay Depth =	1.0 m	(d)
Active Forebay Bottom Width =	21.0 m	
Approximate Permanent Forebay Pool Volume =	224.9 m ³	
Length Width Ratio =	5.2 :1	(r)
25 mm Storm Pond Outlet Flowrate =	0.043 m ³ /s	(Q25mm)
5 Year Storm Inflow Rate =	8.626 m ³ /s	(Q5)
Desired Forebay Velocity =	0.500 m/s	(Vf)
Desired Settling Velocity (recommended) =	0.0003 m/s	(Vs)

Settling Length

$$\text{Dist} = ((r \times Q_{25\text{mm}})/V_s)^{.5} = 27.3 \text{ m} \quad 25\text{mm}$$

Forebay length (140 m) exceeds the settling length (27.3 m).

Dispersion Length

$$\text{Dist} = (8 \times Q_5)/(d \times V_f) = 138.0 \text{ m} \quad 5 \text{ Year}$$

Forebay length (140 m) exceeds the dispersion length (138.0 m).

Flow Velocity in Forebay

Cross-sectional Area (Forebay Only) =	24 m ²	
Cross-sectional Area (With Permanent Pool) =	41.85 m ²	
Cross-sectional Area (With Outlet Pool) =	57.85 m ²	(A)
Q5 =	8.626 m ³ /s	
Velocity = Q5/A =	0.149 m/s	5 Year

The average flow velocity through the forebay is equal to the allowable velocity of 0.15 m/s.

1800 x1800 Structure Controls

Orifice Outlet (Extended Detention)

modelled with 50% blockage

INV = 421.50 m
 Q = 0.044 m³/s
 Cd = 0.600
 H = 1.100 m
 2g = 19.620
 A = 0.031 m²
 D = 0.200 m

Overflow Weir

d1 = 1.500 m
 h = 1.200
 H = 0.300 m
 2g = 19.620
 L = 15.0 m
 Q = 3.524 m³/s

$$\text{Orifice Flow} = Cd A \sqrt{2gH}$$

Cd = Discharge Coefficient
 A = Area of Orifice
 2g = 19.62
 H = Depth of Water above orifice - half of orifice diameter

Major Control - Flow Over Grate

modelled with 50% blockage

d1 = 0.80 m
 h = 0.50
 H = 0.30 m
 2g = 19.62
 L = 3.66 m
 Q = 0.453 m³/s

Length of Weir

Head over Grate (m)	Length (m)
0	1.200
0.1	1.832
0.2	2.464
0.3	3.66

Pipe Outflow - Outlet 1

INV. = 421.34 m
 Diameter = 525 mm
 Gradient = 0.50%
 Pipe Capacity = 0.317 m³/s
 Length = 21.30 m

Pipe Outflow - Outlet 2

INV. = 421.5 m
 Diameter = 600 mm
 Gradient = 1%
 Pipe Capacity = 0.641 m³/s
 Length = 20.30 m

$$\text{Weir Flow} = 0.433 \sqrt{2g\left(\frac{d}{d+h}\right)} LH^{3/2}$$

L = Length of Weir
 2g = 19.62
 d = total depth of water
 h = depth of water below weir
 H = depth of water above weir

Notes:

Major Controls - the minimum of flow over grate and pipe discharge flow rate is used in the actual discharge calculation

Knockout Controls - the knockout is assumed to contribute to discharge flow rates until the pipe discharge rate is the controlling release rate.

Major Control Pipe Flow - based on Pipe Capacity

Appendix D Water Balance Analysis

South Lands Subdivision
Township of Centre Wellington (Fergus)
Monthly Water Balance (Thornthwaite and Mather Method)
Date: February 2025

Table No. 21: Pre-Development Recharge Volume Summary

Catchment	Area	Imperv. (%)	Recharge Depth (mm/yr)	Recharge Volume (m³/yr)
40	3.33	0	328	10922.4
Portion of 30	0.26	5	287	708.89
Portion of 10	15.8	5	308	46230.8
				<hr/> 57,862.09

South Lands Subdivision
Township of Centre Wellington (Fergus)
Monthly Water Balance (Thornthwaite and Mather Method)
Date: February 2025

Table No. 22: Recharge Volume Summary

Catchment	Area	Imperv. (%)	Recharge Depth	Recharge Volume
100	13.09 ha	80	308 mm/yr	8,063 m ³ /yr
200	2.02 ha	15	308 mm/yr	5,288 m ³ /yr
300	1.35 ha	50	308 mm/yr	2,079 m ³ /yr
400	3.33 ha	0	328 mm/yr	10,922 m ³ /yr
600	0.12 ha	5	213 mm/yr	243 m ³ /yr
				26,596 m ³ /yr
Enhanced Infiltration from Infiltration Galleries				33,160 m ³ /yr
				59,756 m³/yr

103% of 57,862 m³/yr required as per
Hydrogeological Investigation

Table 23: Rooftop (100% Impervious)

Contributing Catchments: Rooftops	Soil Type: Fine Sand	Impervious Area = 0.19 ha	Percent of Total Area 100%	Runoff Factor = 1.00
Contributing Area = 0.19 ha	Vegetation: Shallow-rooted crops	Pervious Area = 0.00 ha	0%	
Percent Impervious = 100%	Root Zone Depth = 0.50m	Total Area = 0.19 ha	100%	Evapotranspiration Factor for Impervious Surfaces = 0.34
	Soil Moisture Retention Capacity = 75mm			

Month	Daily Average Temperature	Monthly Heat Index	Unadjusted Daily Potential Evapotranspiration	Correction Factors	Adjusted Potential Evapotranspiration	Average Precipitation	P-PE	Accum. Pot. Notes: Precipitation and Temperature data from Environment Canada Climate Normals 1981-2010 for the Orangeville Weather Station
Monthly water balance strategy as outlined in the document *Instructions and Tables for Computing Potential Evapotranspiration and the Water Balance (Thornthwaite and Mather, 1957)*
Evaporation Factor for Impervious Surfaces = Average Annual Evapotranspiration for Impervious Surfaces (180.3mm/year) / Average Annual Evapotranspiration for Pervious Surfaces (535.5mm/year) = 0.34
Runoff Factor = [(Impervious Percentage of Site x Average Annual Runoff for Impervious Surfaces (765.6mm/year)) + (Pervious Percentage of Site x Average Annual Runoff for Pervious Surfaces (123 mm/year))]/ Total Annual Recharge & Runoff

**South Lands Subdivision
Township of Centre Wellington (Fergus)
File No: 422079**

Table 24: Infiltration Gallery Sizing Calculation

Runoff Depth = 25 mm							Infiltration Gallery					
Type of Lot	Number of Units	Building Width (m)	Building Length (m)	Rooftop Area (m ²)	Required Storage Volume Per Lot (m ³)	Total Storage Volume Required (m ³)	Length (m)	Width (m)	Depth (m)	Stone Volume (m ³)	Storage Volume (m ³)	Total Storage Volume Provided (m ³)
Single Detached (11m - 15.2m lots)	88	9.20	17.00	156.40	3.91	344.08	7.50	1.6	1	12.00	4.00	352.00
Street Townhouse (5.5m - 7m units)	118	5.00	17.00	42.50	1.06	125.38	3.25	1	1	3.25	1.08	127.83
Mixed Use and Medium Density Blocks				1,670.00		41.75	125.00	1	1	125.00	41.67	41.67
Total	206			1,868.90		511.21						521.50

Notes:

- 1.0 Assumes the following lot setbacks:
- 2.0 Assumes stone void ratio of 1/3
- 3.0 Infiltration Galleries sized to infiltrate 25mm design storm event from building rooftops.
- 4.0 For townhome units, it is assumed that only half of the rooftop area can be infiltrated.
- 5.0 Assumes Multiple Residential Block rooftop area to be infiltrated is 25% of block area

Table 25: Enhanced Recharge Calculation - Single Detached Houses

Structure Length =	7.50	m	Gallery Footprint =	12.00	m ²
Structure Width =	1.60	m			
Structure Depth =	1.00	m			
			Volume of Stone =	12.00	m ³
			Stone Porosity =	0.33	
			Storage Volume of Stone =	4.00	m³

Draindown time calculated using the BMP Sizing equation from the Low Impact Development Stormwater Management Planning and Design Guide

$$d_{rmax} = i * t_s / V_r$$

d_{rmax} = depth of stone = 1000.00 mm
 i = infiltration rate for native soils = 15.00 mm/hr
 V_r = void space ratio for aggregate used = 0.33
 t_s = time to drain, solve for t_s

$$t_s = d_{rmax} * V_r / i = 22.00 \text{ hours or } 0.92 \text{ day draindown period}$$

Building Rooftops

Number of Lots =	207	
Rooftop Area (per lot)=	156.40 m ²	0.0156 ha
Total Rooftop Area	3.237 ha	Rooftop Area (ha) x Number of Lots
Recharge Time	22.00 hours	/ 0.92 days
Recharge Volume Potential =	4.00 m ³	(per lot)
Total Recharge Volume Potential =	828.00 m ³	(Recharge Volume Potential x Number of Lots)

Month	Total Runoff (mm)	No. of days	Max Potential Recharge (m ³)	Total Available Recharge (m ³)	Total Enhanced Recharge (m ³)	Available Recharge per Lot (m ³)	Enhanced Recharge per Lot (m ³)
Jan	18.2	31	28,001	589	500	2.8	2.4
