PREPARED BY:

GEI Consultants Canada Limited

Patrick Grier, P.Eng.
Senior Project Engineer

1. Introduction

This report has been prepared to document the servicing and stormwater management system design for the proposed development of 191 Wellington Road 7 and 290 South Street in the Township of Centre Wellington (Elora). The Owner is required to have a Professional Engineer design a stormwater management system and have the said Engineer supervise and certify that the stormwater management system was installed in accordance with the approvals given under Section 41 of the Planning Act.

The legal survey was completed by Black, Shoemaker, Robinson & Donaldson Limited (received December 6th, 2016). The topographical survey was completed by GM BluePlan Engineering Limited (dated December 6th, 2016). The existing and proposed site details are provided on the drawings prepared by GEI Consultants Canada Ltd.

The site is bound by South Street to the east, existing residential lands to the south and north, and Wellington Road 7 to the west. At this time, the intent of the Owner is to construct a 25-unit condominium development on the 0.74 ha site, along with the associated driving, parking and landscaped areas.

2. Site Grading

As illustrated by the topographic survey, the site generally slopes from the northeast to the southwest towards the roadside ditch along Wellington Road 7. The centerline road elevation on South Street along the frontage of the property ranges from approximately 395.0m to 392.0m. The edge of pavement elevation on Wellington Road 7 along the frontage of the property ranges from approximately 394.0m to 390.0m.

The grade and elevations of the site are controlled by the elevation of the existing road elevations of Wellington Road 7 and South Street. The site will be graded to match the existing elevations along the property limits.

3. Site Services

3.1. Water Supply

Water supply for majority of the site is proposed to be provided via the extension of a 150mm diameter water service lateral from the existing 150mm watermain on the South Street right-of-way. Water supply for Block 1 will be supplied via the extension of four (4) 25mm diameter water service laterals from the existing 150mm watermain on the South Street right-of-way.

Fire water supply will be provided by the existing municipal fire hydrants at the intersections of Wellington Road 7 and David Street West and David Street West and South Street.

Table 3-1. Anticipated Water Demands from Site

| | Anticipated Water Demand |
|---|--------------------------|
| Average Water Demand (25 Units @ 2.4 ppl/unit @ 0.004 L/s/cap) | 0.24 L/s |
| Maximum Day (Peak Factor of 2) | 0.48 L/s |

We estimate the fire flow demand for the largest townhouse block of the proposed development with noncombustible construction is 133 L/s, per the FUS approach. A copy of the fire flow demands have been included in Appendix A.

3.2. Sanitary Service

Sanitary service for the site will be provided by a 200mm diameter sanitary sewer extended from the existing 200mm diameter sanitary sewer on the South Street right-of-way. Sanitary services for Block 1 will be provided by the extension of four (4) 100mm diameter sanitary service laterals from the existing 200mm diameter sanitary sewer on South Street. The capacity of the existing 200mm diameter sanitary sewer on South Street is approximately 0.077 m³/s, based on a grade of 4.77%.

The following table summarizes the flows discharging from the site to the municipal sanitary sewer. The sanitary sewer design sheet is provided in Appendix B.

Table 3-2. Anticipated Sanitary Design Flows to South Street

| | Anticipated Sanitary Design Flow |
|---|----------------------------------|
| Peak Sanitary Sewer Flow (25 Units @ 2.4 ppl/unit @ 345.6 L/cap/d) Peak factor = 4 | 0.00127 m ³ /s |
| Extraneous Flow (0.75 ha site @ 0.15 L/s/ha) | 0.00011 m ³ /s |
| Total Sanitary Flow | 0.00139 m ³ /s |
| Existing 200mm Diameter Sanitary Sewer Capacity | 0.077 m ³ /s |

The peak sanitary sewer flow from the development to South Street represents approximately 2% of the existing sanitary sewer capacity. Therefore, in our opinion, the existing 200mm sanitary sewer on South Street has sufficient capacity to convey the anticipated design flows from the proposed development.

3.3. Storm Service

On-site storm sewers have been designed to convey the 100-year design storm event to the proposed detention tank. Storm services for the majority of the site will be provided via 300mm to 525mm diameter storm sewers discharging to the roadside ditch along the Wellington Road 7 right-of-way. A portion of the site will be serviced via a 250mm storm sewer discharging to the existing 250mm storm sewer on South Street. The storm sewer design sheet can be found in Appendix B.

4. Stormwater Management Design

The Fergus Shand Dam rainfall parameters presented in the Stormwater Management Master Plan for Centre Wellington (Elora, Salem and Fergus) (WSP Group, dated April 9, 2024) were used to generate the mass rainfall data for a 4-hour duration rainfall event for the full range of design storms (2 to 100-year). The Chicago storm parameters and the total depth of rainfall for each storm are as follows:

Table 4-1. Fergus Shand Dam – Chicago Storm Parameters

| | 2-Year | 5-Year | 10-Year | 25-Year | 50-Year | 100-Year |
|------------------|---------|---------|---------|---------|---------|----------|
| A | 414.876 | 544.711 | 627.308 | 746.059 | 820.361 | 901.088 |
| B | 0.0268 | 0.0206 | 0.0136 | 0.0851 | 0.0100 | 0.0426 |
| C | 0.682 | 0.686 | 0.687 | 0.692 | 0.691 | 0.692 |
| r | 0.375 | 0.375 | 0.375 | 0.375 | 0.375 | 0.375 |
| Duration (min.) | 240 | 240 | 240 | 240 | 240 | 240 |
| Total Depth (mm) | 39.504 | 50.743 | 58.119 | 67.239 | 74.358 | 81.221 |

The Horton infiltration method was used in the MIDUSS model. The parameters used in MIDUSS are as follows:

Table 4-2. MIDUSS Horton Parameters

| | Impervious Areas | Pervious Areas |
|------------------------------|------------------|----------------|
| Maximum Infiltration (mm/hr) | 0.0 | 75.0 |
| Minimum Infiltration (mm/hr) | 0.0 | 12.5 |
| Lag Constant (hr) | 0.05 | 0.25 |
| Depression Storage (mm) | 1.5 | 5.0 |

The hydrologic model MIDUSS was used to create runoff hydrographs and to route the flows through the storage structures.

4.1. Stormwater Management Criteria

The following are the criteria used to design the stormwater management system for the proposed development:

1. The post-development peak runoff generated from the site is to be attenuated to the existing condition levels plus an additional 20% peak flow reduction, for the full range of design storm events up to and including the 100-year design storm.
2. Enhanced water quality treatment (80% TSS total suspended solids removal) is to be provided prior to the discharge of runoff from the site.
3. Major storm flows are to be routed overland to an appropriate outlet.

4.2. Existing Condition Drainage Areas

For the existing condition analysis, an analysis of two (2) drainage catchments was completed. The existing condition drainage areas are shown in Figure No. 1.

Catchment 10 (0.74-hectares, 2% impervious) represents the existing site, consisting of existing concrete foundations and landscaped areas. Under existing conditions, runoff generated from Catchment 10 sheetflows overland, uncontrolled, to the roadside ditch within the Wellington Road 7 right-of-way.

Catchment 20 (1.32-hectares, 20% impervious) represents the external drainage area northwest of the site, consisting of residential land use area with rooftops, driveways, and landscaped areas. Under existing conditions, runoff generated from Catchment 20 sheetflows overland, uncontrolled to Catchment 10 and eventually drains to the roadside ditch along Wellington Road 7 right-of-way.

The following table summarizes the existing condition flow rates.

Table 4-3. Existing Condition Peak Flow Rates

| | 2-Year | 5-Year | 10-Year | 25-Year | 50-Year | 100-Year |
|-----------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
| Catchment 10 (uncontrolled) | 0.017 m ³ /s | 0.064 m ³ /s | 0.087 m ³ /s | 0.0123 m ³ /s | 0.158 m ³ /s | 0.196 m ³ /s |
| Catchment 20 (uncontrolled) | 0.062 m ³ /s | 0.088 m ³ /s | 0.105 m ³ /s | 0.0128 m ³ /s | 0.146 m ³ /s | 0.165 m ³ /s |
| Total | 0.075 m³/s | 0.142 m³/s | 0.186 m³/s | 0.250 m³/s | 0.304 m³/s | 0.361 m³/s |

4.3. Allowable Release Rates

The post-development flows are to be attenuated to the existing condition levels with an additional 20% water quantity control, for the full range of design storm events up to and including the 100-year design storm. Therefore, the allowable release rate under post-development conditions are as follows:

Table 4-4. Allowable Release Rates

| | 2-Year | 5-Year | 10-Year | 25-Year | 50-Year | 100-Year |
|-----------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| Total Flows from Site | 0.060 m ³ /s | 0.114 m ³ /s | 0.149 m ³ /s | 0.200 m ³ /s | 0.243 m ³ /s | 0.289 m ³ /s |

4.4. Post-Development Condition Drainage Areas

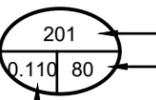

For the post-development condition, an analysis of four (4) drainage catchments was completed. The post-development drainage catchments are shown on Figure No. 2.

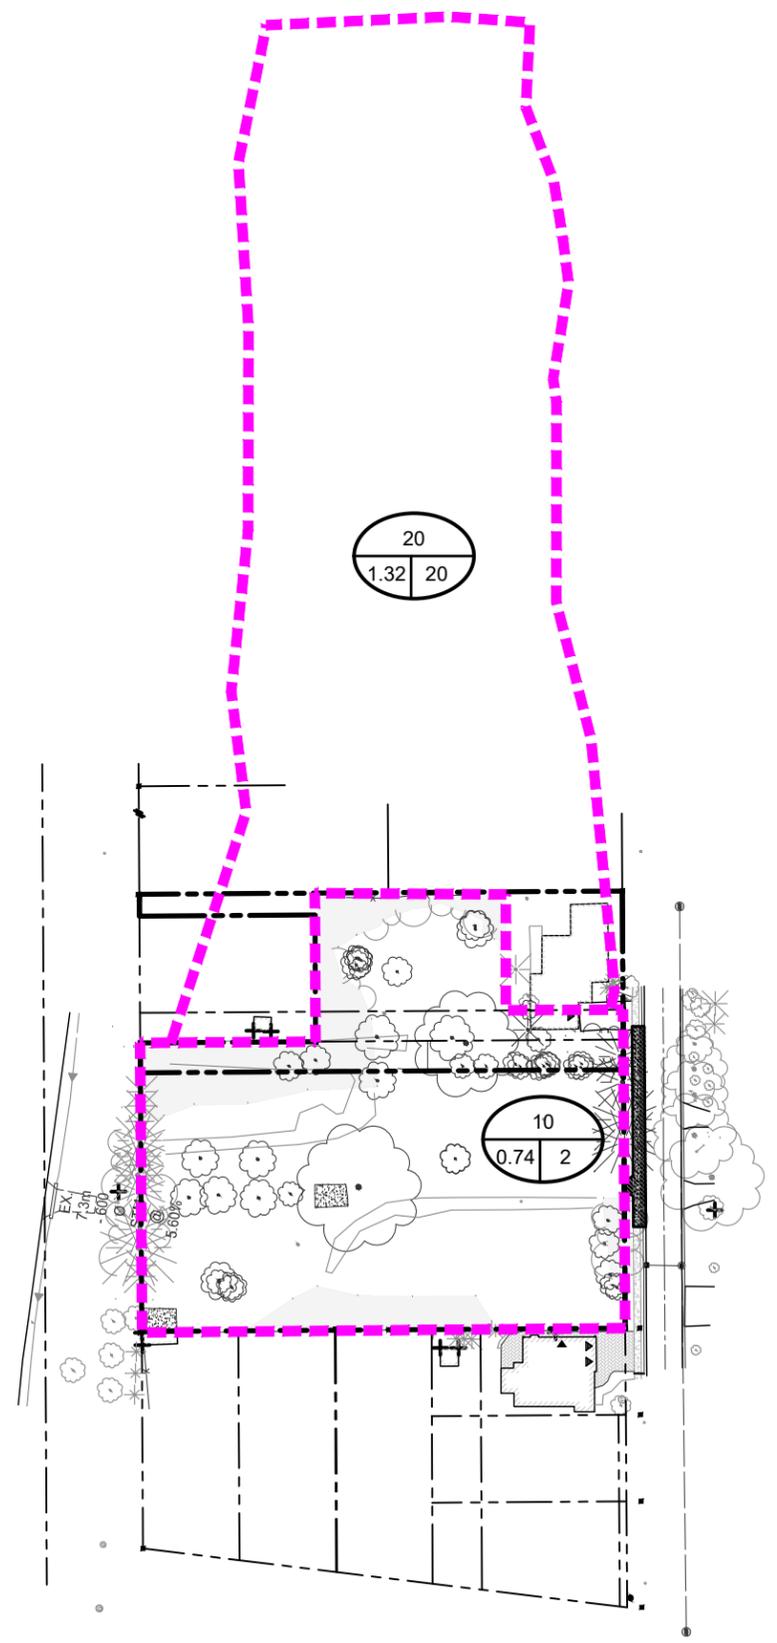

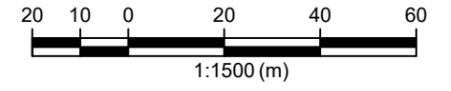

Catchment 100 (0.65-hectares, 65% impervious) represents the majority of the proposed development. Under post-development conditions, runoff generated from Catchment 100 will be captured and conveyed to on-site storm sewers to the proposed underground stormwater tank, ultimately discharging to the roadside ditch along the Wellington Road 7 right-of-way.

FILE: \\Working\james.Keating\Const\2404979 - 416149 Ross Property - 191 South Street, Elora\design Phase\Drawings\416149 - Design.dwg LAYOUT: POST DEVELOPMENT SWM FIG LAST SAVED BY: Eilam3933, 10/29/2025 10:59:29 AM PLOTTED BY: Armstrong, Erin 10/29/2025 11:01:18 AM

The proposed underground stormwater tank (12.81m length x 11.05m width x 1.36m depth) is anticipated to provide 184.8 m³ of storage volume and will be an EZ-Storm system or approved equivalent. Minor storm (2-year design storm) flows will be controlled via the proposed 190mm orifice, while 5-year and major storm flows will be controlled via the proposed 375mm outlet pipe. Storm sewers have been sized such that the 100-year design storm event flows from Catchment 100 and 400 are conveyed to the proposed stormwater tank.

Catchment 200 (0.07-hectares, 45% impervious) represents a portion of the townhouse rooftops, rearyards, and landscaped area along the northeast limit of the site. Under post-development conditions, runoff generated from Catchment 200 will either sheetflow uncontrolled or be conveyed via the rearyard swale and storm sewers to the South Street right-of-way.

Catchment 300 (0.05-hectares, 0% impervious) represents the landscaped area along the southwest limits of the site. Under post-development conditions, runoff generated from Catchment 300 is proposed to sheetflow overland, uncontrolled, towards the roadside ditch within the Wellington Road 7 right-of-way.

Catchment 400 (1.32-hectares, 20% impervious) represents the external drainage area northwest of the site (Catchment 20 under existing conditions), consisting of residential land use area with rooftops, driveways, and landscaped areas. Under post-development conditions, runoff generated from Catchment 400 will continue to sheetflow overland to Catchment 300, where flows will be controlled by the proposed underground stormwater tank before eventually discharging to the roadside ditch along the Wellington Road 7 right of way.

Enhanced level quality control will be provided for Catchment 100 and Catchment 400 via the proposed oil/grit separator structure (Stormceptor EFO6 or approved equivalent). Sizing calculations for the oil/grit separator are presented in Appendix D.

4.4.1. Routing

The Hydrologic model MIDUSS was used to create the 2-100-year design storm runoff hydrographs and to route the hydrographs. A copy of the modelling results of the post-development analysis is appended.

The results of the routing analysis are as follows:

Table 4-5. Catchment 300 Underground Stormwater Tank Storage Stage/Storage/Discharge Capacities

| | Available Capacity | | | Actual Capacity Used | | |
|--------------------------------|--------------------------------|-------------------------------------|---------------------------|--------------------------------|-------------------------------------|---------------------------|
| | Peak Flow m ³ /s | Storage Volume m ³ | Storage Elevation m | Peak Flow m ³ /s | Storage Volume m ³ | Storage Elevation m |
| 190mm Orifice | 0.000 | 0.0 | 389.23 | | | |
| Bottom of Tank | 0.000 | 0.0 | 389.24 | --- | --- | --- |
| 2-Year | --- | --- | --- | 0.057 | 88.8 | 389.89 |
| 375mm Outlet | 0.064 | 108.7 | 390.04 | --- | --- | --- |
| 5-Year | --- | --- | --- | 0.095 | 124.8 | 390.16 |
| 10-Year | --- | --- | --- | 0.129 | 139.1 | 390.26 |
| 25-Year | --- | --- | --- | 0.184 | 155.2 | 390.38 |
| 50-Year | --- | --- | --- | 0.220 | 167.0 | 390.47 |
| 100-Year | --- | --- | --- | 0.261 | 184.2 | 390.60 |
| Top of Tank and T/G CBMH.10 | 0.264 | 184.8 | 390.60 | | | |
| Overflow | 0.617 | 185.5 | 391.10 | --- | --- | --- |

A summary of the post-development peak flow from the site for all design storm events are provided in the table below.

Table 4-6. Summary of Post-Development Peak Flow Rates

| | 2-Year | 5-Year | 10-Year | 25-Year | 50-Year | 100-Year |
|---------------------------------|-----------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
| Catchment 100 (controlled) | 0.057 m ³ /s | 0.095 m ³ /s | 0.129 m ³ /s | 0.183 m ³ /s | 0.220 m ³ /s | 0.261 m ³ /s |
| Catchment 200 (uncontrolled) | 0.012 m ³ /s | 0.019 m ³ /s | 0.017 m ³ /s | 0.022 m ³ /s | 0.026 m ³ /s | 0.041 m ³ /s |
| Catchment 300 (uncontrolled) | 0.005 m ³ /s | 0.011 m ³ /s | 0.011 m ³ /s | 0.012 m ³ /s | 0.016 m ³ /s | 0.025 m ³ /s |
| Total | 0.060m³/s | 0.098 m³/s | 0.133 m³/s | 0.189 m³/s | 0.227 m³/s | 0.276 m³/s |

Table 4-7. Comparison of Allowable Release Rates and Post-Development Flow Rates

| | 2-Year | 5-Year | 10-Year | 25-Year | 50-Year | 100-Year |
|-------------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| Allowable Release Rate | 0.060 m ³ /s | 0.114 m ³ /s | 0.149 m ³ /s | 0.200 m ³ /s | 0.243 m ³ /s | 0.289 m ³ /s |
| Post-Development Flow Rate | 0.060m ³ /s | 0.098 m ³ /s | 0.133 m ³ /s | 0.189 m ³ /s | 0.227 m ³ /s | 0.276 m ³ /s |

Therefore, the post-development flow rates have been attenuated to equal or less than the allowable release rates for the 2-through 100-year design storm events.

5. Maintenance Plan

To ensure that the stormwater management system continues to function as designed and constructed, we recommend that the following inspections and maintenance activities be completed on an annual basis:

1. Inspect the water level in the underground stormwater tank. Has the system completely drained within 48 hours after a storm?
2. Is there any noticeable damage to the underground stormwater tank (i.e. outlet structures, overflow weirs)? If yes, complete any necessary repairs and/or installation of replacement structures.
3. Is there any noticeable damage to the asphalt and grassed swales (i.e. erosion, blockages)? If yes, complete any necessary repairs.
4. Is there any indication of a spill (i.e. frothy water, oily sheen on the water)? If yes, investigate, inform the appropriate agencies and complete the necessary clean-up and restoration.
5. Inspect the oil/grit structure and complete any necessary maintenance/repair activities as identified by the manufacturer.
6. Inspect all catchbasins and manholes. Remove and dispose of any accumulated sediment, trash/litter, debris (i.e. sediment, garbage, leaves, etc.).
7. Inspect all swales and overflow locations. Remove and dispose of any accumulated sediment, trash/litter, debris (i.e. sediment, garbage, leaves, etc.).

Please note that any structures identified during the annual inspection to be worn, missing or damaged are to be repaired or replaced within 48 hours.

6. Erosion and Sediment Control Plan

A silt fence is to be installed along the perimeter of the property. The silt fence serves to minimize the opportunity for sediment to leave the site.

Inspection and maintenance of all silt fencing will start after installation is complete. The silt fence will be inspected on a weekly basis during active construction or after a rainfall event of 13 mm or greater. Maintenance will be carried out, within 48 hours, on any part of the silt fence found to need repair.

Once construction and landscaping has been substantially completed, the silt fence will be removed, any accumulated sediment will be removed, and the landscaping will be completed.

After construction of the complete development, erosion will not occur, and sediment transport will be minimal.

7. Conclusions

In summary, the features of the design for the proposed development are as follows:

1. It is proposed that the development will be accessed by South Street and Wellington Road 7 and that the grading of the development is controlled by the existing elevations of South Street and Wellington Road 7 across the frontages of the site.
2. Water supply for majority of the site is proposed to be provided via the extension of a 150mm diameter water service lateral from the existing 150mm watermain on the South Street right-of-way. Water supply for Block 1 will be supplied via the extension of four (4) 25mm diameter water service laterals from the existing 150mm watermain on the South Street right-of-way.
3. Sanitary service for the proposed development will be provided by a 200mm diameter sanitary sewer extended from the existing 200mm diameter sanitary sewer on the South Street right-of-way. Sanitary services for Block 1 will be provided by the extension of four (4) 100mm diameter sanitary service laterals from the existing 200mm diameter sanitary sewer on South Street.
4. Storm service for majority of the development will be provided via a 525mm diameter storm sewer discharging to the roadside ditch along the Wellington Road 7 right-of-way. A portion of the development will be serviced via a 250mm diameter storm sewer discharging to the existing 250mm storm sewer on South Street.
5. Post-development flow rates have been attenuated to equal or less than the allowable release rates for the 2 through 100-year design storm events.
6. Quality control treatment for runoff generated from Catchment 100 and Catchment 400 will be provided by the oil/grit separator structure (Stormceptor EF06 or approved equivalent) prior to discharge from the site.
7. Prior to construction, a silt fence will be installed along the property boundary in all locations where runoff will discharge from the site to adjacent lands. This will minimize the transport of sediment off-site during the construction period.

TANK DIMENSIONS

Length = 12.81 m
 Width = 11.05 m
 Height = 1.36 m
 Volume = 184.8 m³

Outlet 1 CALCULATION

Q = 0.100 m³/s
 Cd = 0.6
 H = 1.76 m
 2g = 19.62
 A = 0.028 m²
 D = 0.190 m
 D/2 = 0.095 m
 Elev = 389.23 masl

Outlet 2 CALCULATION

Q = 0.274 m³/s
 Cd = 0.6
 H = 0.87 m
 2g = 19.62
 A = 0.110 m²
 D = 0.375 m
 D/2 = 0.1875 m
 Elev = 390.04 masl

OVERFLOW WEIR

Q = 0.243 cu m/s
 d1 = 0.400 m
 h = 0.500 m
 H = 0.100 m
 2g = 19.620
 L = 6.000 m

DISCHARGE

| ELEV | STAGE | STORAGE | OUTLET 1 | OUTLET 2 | WEIR | TOTAL | |

Stormceptor® **EF** Sizing Report

THIRD-PARTY TESTING AND VERIFICATION

► Stormceptor® EF and Stormceptor® EFO are the latest evolutions in the Stormceptor® oil-grit separator (OGS) technology series, and are designed to remove a wide variety of pollutants from stormwater and snowmelt runoff. These technologies have been third-party tested in accordance with the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** and performance has been third-party verified in accordance with the **ISO 14034 Environmental Technology Verification (ETV)** protocol.

PERFORMANCE

► Stormceptor® EF and EFO remove stormwater pollutants through gravity separation and floatation, and feature a patent-pending design that generates positive removal of total suspended solids (TSS) throughout each storm event, including high-intensity storms. Captured pollutants include sediment, free oils, and sediment-bound pollutants such as nutrients, heavy metals, and petroleum hydrocarbons. Stormceptor is sized to remove a high level of TSS from the frequent rainfall events that contribute the vast majority of annual runoff volume and pollutant load. The technology incorporates an internal bypass to convey excessive stormwater flows from high-intensity storms through the device without resuspension and washout (scour) of previously captured pollutants. Proper routine maintenance ensures high pollutant removal performance and protection of downstream waterways.

PARTICLE SIZE DISTRIBUTION (PSD)

► The Canadian ETV PSD shown in the table below was used, or in part, for this sizing. This is the identical PSD that is referenced in the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** for both sediment removal testing and scour testing. The Canadian ETV PSD contains a wide range of particle sizes in the sand and silt fractions, and is considered reasonably representative of the particle size fractions found in typical urban stormwater runoff.

| Particle Size (µm) | Percent Less Than | Particle Size Fraction (µm) | Percent |
|--------------------|-------------------|-----------------------------|---------|
| 1000 | 100 | 500-1000 | 5 |
| 500 | 95 | 250-500 | 5 |
| 250 | 90 | 150-250 | 15 |

SCOUR PREVENTION AND ONLINE CONFIGURATION

► Stormceptor® EF and EFO feature an internal bypass and superior scour prevention technology that have been demonstrated in third-party testing according to the scour testing provisions of the Canadian ETV Procedure for Laboratory Testing of Oil-Grit Separators, and the exceptional scour test performance has been third-party verified in accordance with the ISO 14034 ETV protocol. As a result, Stormceptor EF and EFO are approved for online installation, eliminating the need for costly additional bypass structures, piping, and installation expense.

DESIGN FLEXIBILITY

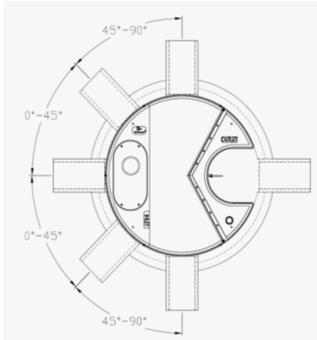

► Stormceptor® EF and EFO offers design flexibility in one simplified platform, accepting stormwater flow from a single inlet pipe or multiple inlet pipes, and/or surface runoff through an inlet grate. The device can also serve as a junction structure, accommodate a 90-degree inlet-to-outlet bend angle, and can be modified to ensure performance in submerged conditions.

OIL CAPTURE AND RETENTION

► While Stormceptor® EF will capture and retain oil from dry weather spills and low intensity runoff, Stormceptor® EFO has demonstrated superior oil capture and greater than 99% oil retention in third-party testing according to the light liquid re-entrainment testing provisions of the Canadian ETV Procedure for Laboratory Testing of Oil-Grit Separators. Stormceptor EFO is recommended for sites where oil capture and retention is a requirement.

Stormceptor® EF Sizing Report

INLET-TO-OUTLET DROP

Elevation differential between inlet and outlet pipe inverts is dictated by the angle at which the inlet pipe(s) enters the unit.

0° - 45° : The inlet pipe is 1-inch (25mm) higher than the outlet pipe.

45° - 90° : The inlet pipe is 2-inches (50mm) higher than the outlet pipe.

HEAD LOSS

The head loss through Stormceptor EF is similar to that of a 60-degree bend structure. The applicable K value for calculating minor losses through the unit is 1.1. For submerged conditions the applicable K value is 3.0.

Pollutant Capacity

| Stormceptor EF / EFO | Model Diameter | | Depth (Outlet Pipe Invert to Sump Floor) | | Oil Volume | | Recommended Sediment Maintenance Depth * | | Maximum Sediment Volume * | | Maximum Sediment Mass ** | |

STANDARD STORMCEPTOR EF/EFO SPECIFICATION

For specifications, please visit <http://www.imbriumsystems.com/stormwater-treatment-solutions/stormceptor-ef>

STANDARD PERFORMANCE SPECIFICATION FOR “OIL GRIT SEPARATOR” (OGS) STORMWATER QUALITY TREATMENT DEVICE

PART 1 – GENERAL

1.1 WORK INCLUDED

This section specifies requirements for selecting, sizing, and designing an underground Oil Grit Separator (OGS) device for stormwater quality treatment, with third-party testing results and a Statement of Verification in accordance with ISO 14034 Environmental Management – Environmental Technology Verification (ETV).

1.2 REFERENCE STANDARDS & PROCEDURES

ISO 14034:2016 Environmental management – Environmental technology verification (ETV)

Canadian Environmental Technology Verification (ETV) Program’s **Procedure for Laboratory Testing of Oil-Grit Separators**

1.3 SUBMITTALS

1.3.1 All submittals, including sizing reports & shop drawings, shall be submitted upon request with each order to the contractor then forwarded to the Engineer of Record for review and acceptance. Shop drawings shall detail all OGS components, elevations, and sequence of construction.

1.3.2 Alternative devices shall have features identical to or greater than the specified device, including: treatment chamber diameter, treatment chamber wet volume, sediment storage volume, and oil storage volume.

1.3.3 Unless directed otherwise by the Engineer of Record, OGS stormwater quality treatment product substitutions or alternatives submitted within ten days prior to project bid shall not be accepted. All alternatives or substitutions submitted shall be signed and sealed by a local registered Professional Engineer, based on the exact same criteria detailed in Section 3, in entirety, subject to review and approval by the Engineer of Record.

PART 2 – PRODUCTS

2.1 OGS POLLUTANT STORAGE

The OGS device shall include a sump for sediment storage, and a protected volume for the capture and storage of petroleum hydrocarbons and buoyant gross pollutants. The minimum sediment & petroleum hydrocarbon storage capacity shall be as follows:

| | | |
|-------|-------------------------------------|---|
| 2.1.1 | 4 ft (1219 mm) Diameter OGS Units: | 1.19 m ³ sediment / 265 L oil |
| | 5 ft (1524 mm) Diameter OGS Units: | 1.95 m ³ sediment / 420 L oil |
| | 6 ft (1829 mm) Diameter OGS Units: | 3.48 m ³ sediment / 609 L oil |

PART 3 – PERFORMANCE & DESIGN

Stormceptor® EF Sizing Report

3.1 GENERAL

The OGS stormwater quality treatment device shall be verified in accordance with ISO 14034:2016 Environmental management – Environmental technology verification (ETV). The OGS stormwater quality treatment device shall remove oil, sediment and gross pollutants from stormwater runoff during frequent wet weather events, and retain these pollutants during less frequent high flow wet weather events below the insert within the OGS for later removal during maintenance. The Manufacturer shall have at least ten (10) years of local experience, history and success in engineering design, manufacturing and production and supply of OGS stormwater quality treatment device systems, acceptable to the Engineer of Record.

3.2 SIZING METHODOLOGY

The OGS device shall be engineered, designed and sized to provide stormwater quality treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the sediment (TSS) load based on the Particle Size Distribution (PSD) specified in the sizing report for the specified device. Sizing of the OGS shall be determined by use of a minimum ten (10) years of local historical rainfall data provided by Environment Canada. Sizing shall also be determined by use of the sediment removal performance data derived from the ISO 14034 ETV third-party verified laboratory testing data from testing conducted in accordance with the Canadian ETV protocol Procedure for Laboratory Testing of Oil-Grit Separators, as follows:

3.2.1 Sediment removal efficiency for a given surface loading rate and its associated flow rate shall be based on sediment removal efficiency demonstrated at the seven (7) tested surface loading rates specified in the protocol, ranging 40 L/min/m² to 1400 L/min/m², and as stated in the ISO 14034 ETV Verification Statement for the OGS device.

3.2.2 Sediment removal efficiency for surface loading rates between 40 L/min/m² and 1400 L/min/m² shall be based on linear interpolation of data between consecutive tested surface loading rates.

3.2.3 Sediment removal efficiency for surface loading rates less than the lowest tested surface loading rate of 40 L/min/m² shall be assumed to be identical to the sediment removal efficiency at 40 L/min/m². No extrapolation shall be allowed that results in a sediment removal efficiency that is greater than that demonstrated at 40 L/min/m².

3.2.4 Sediment removal efficiency for surface loading rates greater than the highest tested surface loading rate of 1400 L/min/m² shall assume zero sediment removal for the portion of flow that exceeds 1400 L/min/m², and shall be calculated using a simple proportioning formula, with 1400 L/min/m² in the numerator and the higher surface loading rate in the denominator, and multiplying the resulting fraction times the sediment removal efficiency at 1400 L/min/m².

The OGS device shall also have sufficient annual sediment storage capacity as specified and calculated in Section 2.1.

3.3 CANADIAN ETV or ISO 14034 ETV VERIFICATION OF SCOUR TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of third-party scour testing conducted in accordance with the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators**.

3.3.1 To be acceptable for on-line installation, the OGS device must demonstrate an average scour test effluent concentration less than 10 mg/L at each surface loading rate tested, up to and including 2600 L/min/m².

3.4 LIGHT LIQUID RE-ENTRAINMENT SIMULATION TESTING

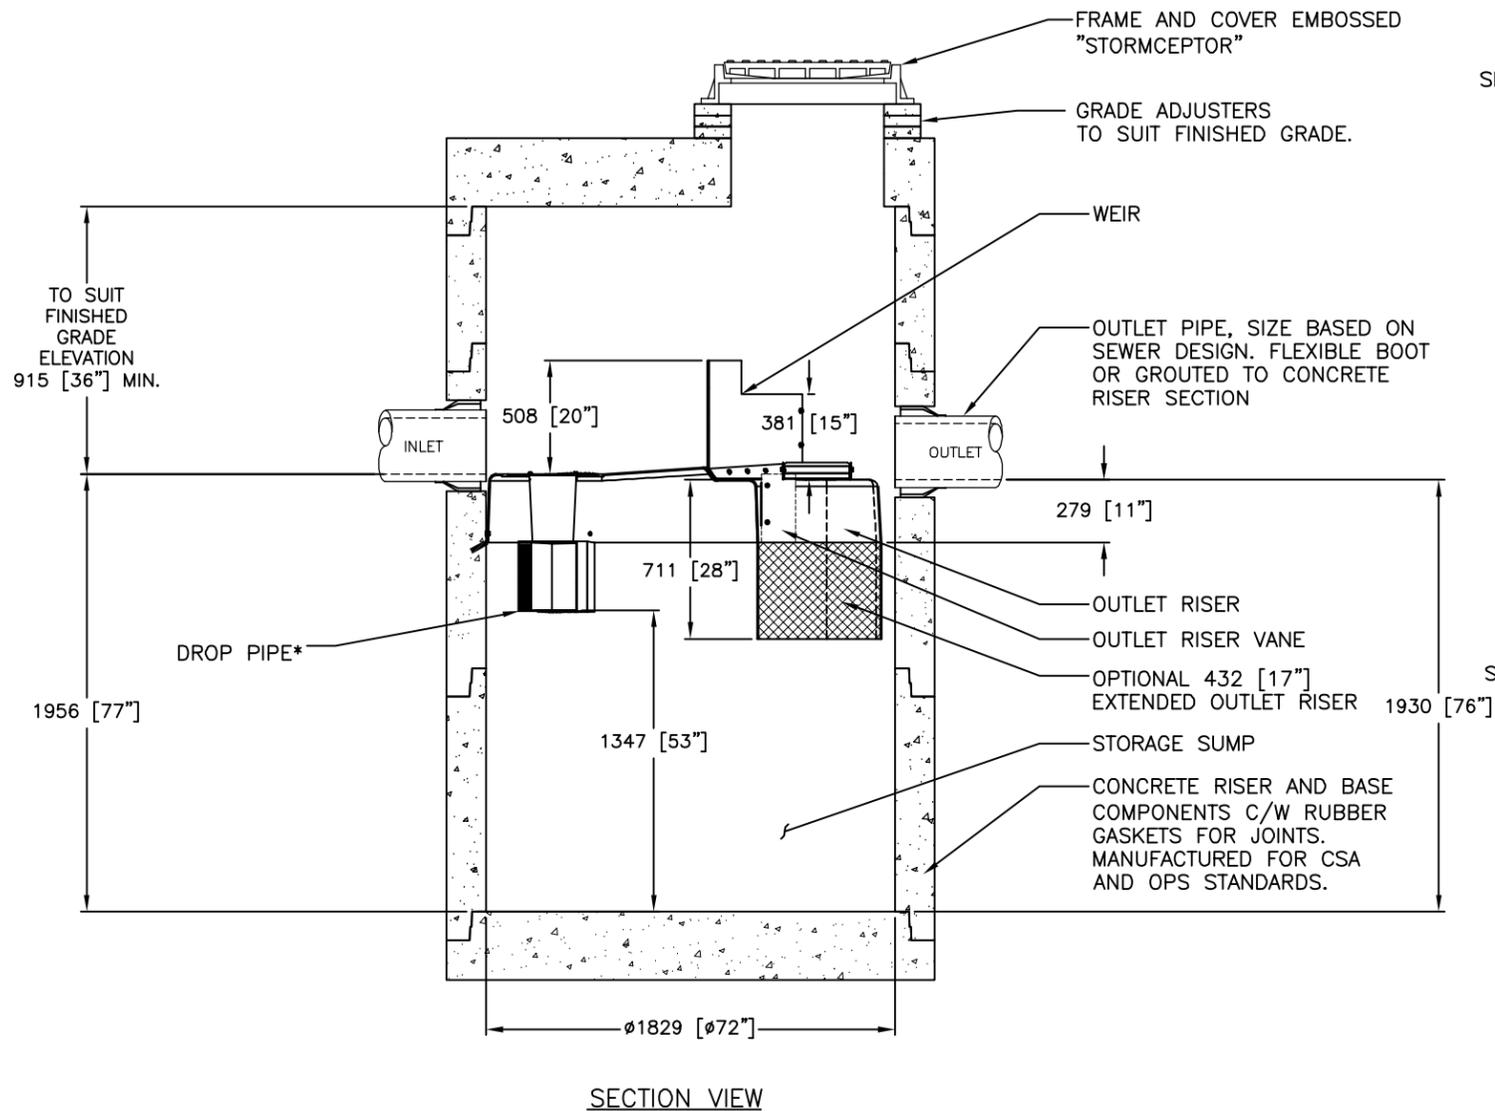

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of completed third-party Light Liquid

Stormceptor® **EF** Sizing Report

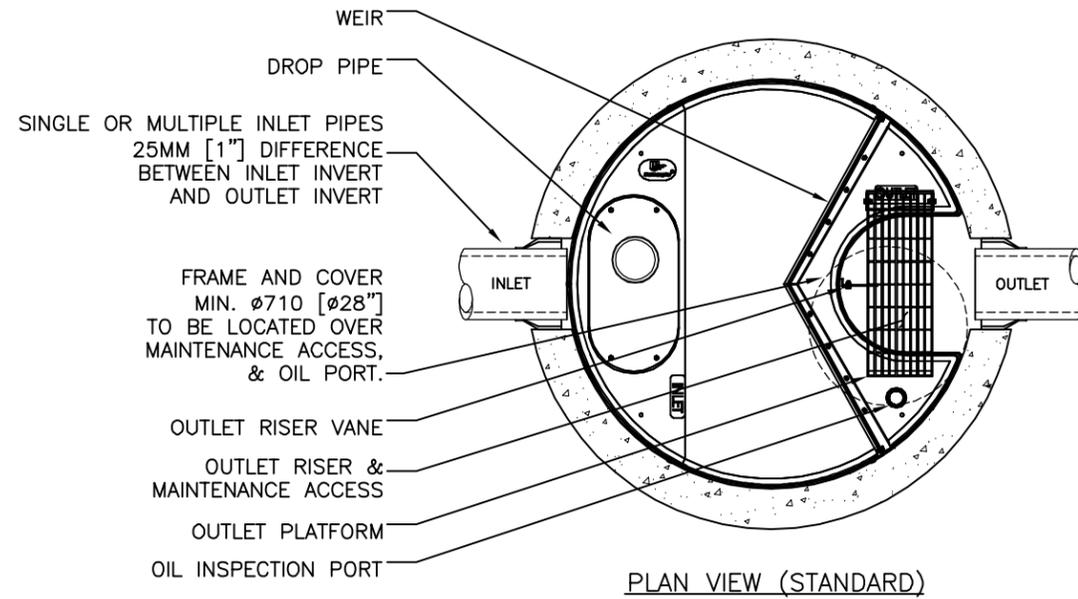

Re-entrainment Simulation Testing in accordance with the Canadian ETV **Program's Procedure for Laboratory Testing of Oil-Grit Separators**, with results reported within the Canadian ETV or ISO 14034 ETV verification. This re-entrainment testing is conducted with the device pre-loaded with low density polyethylene (LDPE) plastic beads as a surrogate for light liquids such as oil and fuel. Testing is conducted on the same OGS unit tested for sediment removal to assess whether light liquids captured after a spill are effectively retained at high flow rates.

3.4.1 For an OGS device to be an acceptable stormwater treatment device on a site where vehicular traffic occurs and the potential for an oil or fuel spill exists, the OGS device must have reported verified performance results of greater than 99% cumulative retention of LDPE plastic beads for the five specified surface loading rates (ranging 200 L/min/m² to 2600 L/min/m²) in accordance with the Light Liquid Re-entrainment Simulation Testing within the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators**. However, an OGS device shall not be allowed if the Light Liquid Re-entrainment Simulation Testing was performed with screening components within the OGS device that are effective at retaining the LDPE plastic beads, but would not be expected to retain light liquids such as oil and fuel.

GENERAL NOTES:

- * MAXIMUM SURFACE LOADING RATE (SLR) INTO LOWER CHAMBER THROUGH DROP PIPE IS 1135 L/min/m² (27.9 gpm/ft²) FOR STORMCEPTOR EF6 AND 535 L/min/m² (13.1 gpm/ft²) FOR STORMCEPTOR EFO6 (OIL CAPTURE CONFIGURATION).
- 1. ALL DIMENSIONS INDICATED ARE IN MILLIMETERS (INCHES) UNLESS OTHERWISE SPECIFIED.
- 2. STORMCEPTOR STRUCTURE INLET AND OUTLET PIPE SIZE AND ORIENTATION SHOWN FOR INFORMATIONAL PURPOSES ONLY.
- 3. UNLESS OTHERWISE NOTED, BYPASS INFRASTRUCTURE, SUCH AS ALL UPSTREAM DIVERSION STRUCTURES, CONNECTING STRUCTURES, OR PIPE CONDUITS CONNECTING TO COMPLETE THE STORMCEPTOR SYSTEM SHALL BE PROVIDED AND ADDRESSED SEPARATELY.
- 4. DRAWING FOR INFORMATION PURPOSES ONLY. REFER TO ENGINEER'S SITE/UTILITY PLAN FOR STRUCTURE ORIENTATION.
- 5. NO PRODUCT SUBSTITUTIONS SHALL BE ACCEPTED UNLESS SUBMITTED 10 DAYS PRIOR TO PROJECT BID DATE, OR AS DIRECTED BY THE ENGINEER OF RECORD.

INSTALLATION NOTES

- A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
- B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE STRUCTURE (LIFTING CLUTCHES PROVIDED)
- C. CONTRACTOR WILL INSTALL AND LEVEL THE STRUCTURE, SEALING THE JOINTS, LINE ENTRY AND EXIT POINTS (NON-SHRINK GROUT WITH APPROVED WATERSTOP OR FLEXIBLE BOOT)
- D. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO PROTECT THE DEVICE FROM CONSTRUCTION-RELATED EROSION RUNOFF.
- E. DEVICE ACTIVATION, BY CONTRACTOR, SHALL OCCUR ONLY AFTER SITE HAS BEEN STABILIZED AND THE STORMCEPTOR UNIT IS CLEAN AND FREE OF DEBRIS.

FOR SITE SPECIFIC DRAWINGS PLEASE CONTACT YOUR LOCAL STORMCEPTOR REPRESENTATIVE. SITE SPECIFIC DRAWINGS ARE BASED ON THE BEST AVAILABLE INFORMATION AT THE TIME. SOME FIELD REVISIONS TO THE SYSTEM LOCATION OR CONNECTION PIPING MAY BE NECESSARY BASED ON AVAILABLE SPACE OR SITE CONFIGURATION REVISIONS. ELEVATIONS SHOULD BE MAINTAINED EXCEPT WHERE NOTED ON BYPASS STRUCTURE (IF REQUIRED).
